Axial Piston Variable Pump
A18VO Series 11

Features
▶ Variable pump with axial tapered piston rotary group of bent-axis design with special characteristics and dimensions for use in commercial vehicles.
▶ The flow is proportional to the drive speed and displacement.
▶ The flow can be infinitely varied by adjusting the bent-axis angle.
▶ Favorable power-to-weight ratio, compact dimensions, optimum efficiency, economical design
▶ High self-suction capability
▶ Flange and shaft designed for direct mounting on the power take-off of commercial vehicles
▶ Low noise levels
▶ Increased pressure (350/400 bar) compared to standard pump A17VO

Technical data

Hydraulic fluid

Before starting project planning, please refer to our data sheets RE 90220 (mineral oil) and RE 90221 (environmentally acceptable hydraulic fluids) for detailed information regarding the choice of hydraulic fluid and application conditions.

If environmentally acceptable hydraulic fluids are used, the limitations regarding technical data or other seals must be observed. Please contact us.

Note

Variable pump A18VO is not suitable for operation with water-containing HF hydraulic fluid.

Details regarding the choice of hydraulic fluid

The correct choice of hydraulic fluid requires knowledge of the operating temperature in relation to the ambient temperature: in an open circuit the reservoir temperature. The hydraulic fluid should be chosen so that the operating viscosity in the operating temperature range is within the optimum range (\(\nu_{\text{opt}}\), see shaded area of the selection diagram). We recommended that the higher viscosity class be selected in each case.

Example: At an ambient temperature of \(X \, ^\circ C\), an operating temperature of \(60 \, ^\circ C\) is set in the circuit. In the optimum operating viscosity range (\(\nu_{\text{opt}}\), shaded area), this corresponds to the viscosity classes VG 46 or VG 68; to be selected: VG 68.

Note

The case drain temperature, which is affected by pressure and speed, can be higher than the reservoir temperature. At no point of the component may the temperature be higher than \(115 \, ^\circ C\). The temperature difference specified below is to be taken into account when determining the viscosity in the bearing.

If the above conditions cannot be maintained due to extreme operating parameters, please contact us.

</table>
Filtration of the hydraulic fluid
Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.
To ensure the functional reliability of the axial piston unit, a gravimetric analysis of the hydraulic fluid is necessary to determine the amount of solid contaminant and to determine the cleanliness level according to ISO 4406. A cleanliness level of at least 20/18/15 is to be maintained.
At very high hydraulic fluid temperatures (90 °C to maximum 115 °C), a cleanliness level of at least 19/17/14 according to ISO 4406 is necessary.
If the above classes cannot be achieved, please contact us.

Case drain fluid
The case drain chamber is connected to the suction chamber. A case drain line from the case to the reservoir is not required (port "R" is plugged).
On versions with DRS control, a case drain line for discharge from port "T" to the reservoir is absolutely essential (not necessary for EP control).

Shaft seal
The FKM shaft seal may be used for case drain temperatures from -25 °C to +115 °C.

Note
For the temperature range below -25 °C, the values in the table on page 3 are to be observed.
Operating pressure range
Valid when using hydraulic fluids based on mineral oils

<sup>1)</sup> The values are valid:
- at an absolute pressure $p_{abs} = 1$ bar at suction port $S$
- for the optimum viscosity range from $\nu_{opt} = 36$ to $16 \ mm²/s$
- with hydraulic fluid based on mineral oils

<sup>2)</sup> Maximum rotational speed (limit speed) for increased inlet pressure $p_{abs}$ at suction port $S$ and $V_{g} < V_{g\ max}$, see the following diagram

### Determining the operating characteristics

#### Formulas

<table>
<thead>
<tr>
<th>Flow</th>
<th>$q_{v} = \frac{V_{g} \cdot n \cdot \eta_{v}}{1000}$ [L/min]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Torque</td>
<td>$T = \frac{V_{g} \cdot \Delta p}{20 \cdot \pi \cdot \eta_{mh}}$ [Nm]</td>
</tr>
<tr>
<td>Power</td>
<td>$P = \frac{2 \pi \cdot T \cdot n}{60000} = \frac{q_{v} \cdot \Delta p}{600 \cdot \eta_{t}}$ [kW]</td>
</tr>
</tbody>
</table>

#### Key

- $V_{g}$ = Displacement per revolution in cm³
- $\Delta p$ = Differential pressure in bar
- $n$ = Speed in rpm
- $\eta_{v}$ = Volumetric efficiency
- $\eta_{mh}$ = Mechanical-hydraulic efficiency
- $\eta_{t}$ = Total efficiency ($\eta_{t} = \eta_{v} \cdot \eta_{mh}$)

### Note

Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. Other permissible limit values, with respect to speed variation, reduced angular acceleration as a function of the frequency and the permissible start up angular acceleration (lower than the maximum angular acceleration) can be found in data sheet RE 90261.
### Permissible axial forces of the drive shaft

The values given are maximum values and do not apply to continuous operation. For drives with radial loading (pinion, V-belt drives), please contact us!

#### Note

Influence of the direction of the permissible axial force:

$+ F_{\text{ax max}} = $ Increase in service life of bearings

$- F_{\text{ax max}} = $ Reduction in service life of bearings (avoid)
DRS – Pressure controller with load sensing

Function of the pressure controller
The pressure controller limits the maximum pressure at the pump outlet within the control range of the pump. The variable pump only delivers as much hydraulic fluid as the consumers actually need. If the operating pressure exceeds the pressure setpoint set at the integrated pressure valve, the pump will regulate to a smaller displacement to reduce the control deviation.

In a non-pressurized state, the pump is swiveled to its initial position to $V_{g\ max}$ by a return spring.

▶ Setting range for pressure control: 80 to 400 bar
▶ Standard setting: 350 bar

Note
A pressure-relief valve is provided to limit the maximum pressure in the system. This must be at least 20 bar above the control setting at the start of opening.

The pressure controller overrides the load sensing controller, i.e. the load sensing function operates below the set pressure.

Load sensing function
The load sensing controller works as a load-pressure controlled flow compensator and adjusts the displacement of the pump to the volume required by the consumer.

The flow of the pump is then dependent on the cross section of the external metering orifice (1), which is located between the pump and the consumer. Below the setting of the pressure control and within the control range of the pump, the flow is not dependent on the load pressure.

As a rule, the metering orifice is a separately located load sensing directional valve (control block). The position of the directional valve piston determines the opening cross section of the metering orifice and thus the flow of the pump.

The load sensing controller compares the pressure before the metering orifice with that after the orifice and maintains the pressure drop encountered here (differential pressure $\Delta p$) and thus the flow constant.

If the differential pressure $\Delta p$ at the metering orifice rises, the pump is swiveled back (toward $V_{g\ min}$). If the differential pressure $\Delta p$ drops, the pump is swiveled out (toward $V_{g\ max}$) until equilibrium at the metering orifice is restored.

$$\Delta p_{\text{Metering orifice}} = p_{\text{Pump}} - p_{\text{Consumer}}$$

▶ Setting range for $\Delta p$ 19 to 40 bar
▶ Standard setting: 30 bar

The stand-by pressure in zero-stroke mode (metering orifice closed) is slightly higher than the $\Delta p$ setting.
**Zero-stroke mode**

The standard version is designed for intermittent, constant-pressure operation. Short-term (< 1 min), zero-stroke operation is permissible up to an operating pressure $p_{\text{nom}} = 350$ bar with reservoir temperature $\leq 50$ °C.

**Note**

To ensure thermal stability, a case drain line from port "T" to the reservoir is generally required with the DRS controller (not needed for EP control).

When ordering, please state in plain text:
- Pressure control setting
- $\Delta p$ setting for load sensing function

If these details are missing from the order, the pump will be delivered with the standard setting, see page 8.

(1) The sensing orifice (control block) is not included in the delivery contents.
EP – Proportional control electric

The proportional control electric, provides infinite adjustment of the displacement, proportional to the control current applied to the solenoid.

EP2 – positive control
Adjustment from $V_{g\ min}$ to $V_{g\ max}$
With increasing control current, the pump swivels to a higher displacement. A control pressure is required to swivel the pump from its initial position $V_{g\ min}$ to $V_{g\ max}$. The necessary control power is taken from the operating pressure. To enable a pressure to be built up, a residual volume of approx. 10% of $V_{g\ max}$ is a fixed setting.

EP6 – negative control
Adjustment from $V_{g\ max}$ to $V_{g\ min}$
With increasing control current, the pump swivels to a lower displacement. The necessary control power is taken from the operating pressure.

The following electronic controllers and amplifiers are available for controlling the proportional solenoids:
- BODAS controller RC
  - RE 95200 – series 20
  - RE 95201 – series 21
  - RE 95202 – series 22
  - RE 95203, RE 95204 – series 30
  and application software
- RE 95230 – Analog amplifier RA

Further information can also be found on the Internet at www.boschrexroth.com/mobile-electronics.
Note

The spring return feature in the controller is not a safety device. The controller can stick in an undefined position by internal contamination (contaminated hydraulic fluid, abrasion or residual contamination from system components). As a result, the control will no longer respond correctly to the operator's commands. Check whether the application on your machine requires additional safety measures, in order to bring the driven actuator into a controlled and safe position (e.g. immediate stop).

Dimensions in mm
Notes on suction line
- Keep as short and straight as possible, without bend
- Use a supporting ring for plastic hoses
- Use two hose clamps to protect the suction hose against air suction
- Note pressure resistance of suction hose compared to ambient pressure

Replacing seals
The O-rings used as seals to prevent air from entering the suction line are to be replaced after every removal and new installation in order to guarantee complete sealing.

Material number for O-rings:
- R902083802: O-ring for suction stud G1
- R902083808: O-ring for suction stud G1 1/4

Coupling flange
There are specially modified coupling flanges in 4-hole and 6-hole designs for the cardan-shaft drive.

4-hole coupling flange, complete – Ø90
Material number: R902060152

6-hole coupling flange, complete – Ø100
Material number: R902060153

Note
The coupling flange is installed by screwing it onto the drive shaft with the help of the threaded bore in the end of the drive shaft.
The coupling flange must be glued onto the splined drive shaft with Loctite 574 and clamped (= 130 Nm). Sudden or abrupt forces acting on the drive shaft could lead to damage to the rotary group and must therefor be avoided.
Connector for solenoids

DEUTSCH DT04-2P-EP04
Molded, 2-pin, without bidirectional suppressor diode
There is the following type of protection with mounted mating connector:
▶ IP67 (DIN/EN 60529) and
▶ IP69K (DIN 40050-9)

▼ Circuit symbol

Mating connector
DEUTSCH DT06-2S-EP04
Bosch Rexroth Mat. No. R902601804

</tr>
</tbody>
</table>

The mating connector is not included in the delivery contents. This can be supplied by Bosch Rexroth on request.

Changing connector orientation
If necessary, you can change the connector orientation by turning the solenoid housing.
To do this, proceed as follows:
▶ Loosen the mounting nut (1) of the solenoid. To do this, turn the mounting nut (1) one turn counter-clockwise.
▶ Turn the solenoid body (2) to the desired orientation.
▶ Retighten the mounting nut. Tightening torque: 5+1 Nm. (WAF26, 12-sided DIN 3124)
On delivery, the connector orientation may differ from that shown in the brochure or drawing.
Installation instructions

General
During commissioning and operation, the axial piston unit must be filled with hydraulic fluid and air bled. This must also be observed following a relatively long standstill as the axial piston unit may drain back to the reservoir via the hydraulic lines.

The case drain chamber is internally connected to the suction chamber. A case drain line from the case to the reservoir is not required. However, to ensure thermal stability, a case drain line from port "T" to the reservoir is generally required with the DRS controller.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the suction and case drain lines must flow into the reservoir below the minimum fluid level. The permissible suction height $h_S$ results from the overall loss of pressure; it must not, however, be higher than $h_{S\,max} = 800$ mm. The minimum suction pressure at port S must also not fall below 0.8 bar absolute during operation and during cold start.

Installation position
See the following examples 1 to 4.

Further installation positions are available upon request. Recommended installation position: 1 and 2.

Below-reservoir installation (standard)
Below-reservoir installation means that the axial piston unit is installed outside of the reservoir below the minimum fluid level.

<table>

<td>S</td>
</tr>
</tbody>
</table>

Above-reservoir installation
Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir. Observe the maximum permissible suction height $h_{S\,max} = 800$ mm.

Installation position Air bleed Filling
3 $R$ $L$
4 $M_S$ $L$

Key
- L Filling / air bleed
- R Air bleed port
- S Suction port
- T Drain port (DRS only)
- SB Baffle (baffle plate)
- $h_{t\,min}$ Minimum required immersion depth (200 mm)
- $h_{min}$ Minimum required spacing to reservoir bottom (100 mm)
- $h_{S\,max}$ Maximum permissible suction height (800 mm)
- $M_S$ Measuring port suction pressure
- $a_{min}$ When designing the reservoir, ensure adequate space between the suction line and the case drain line. This prevents the heated, return flow from being drawn directly back into the suction line.
Other related documents

Other pumps with special characteristics and dimensions for use in commercial vehicles can be found in the following data sheets:

- RE 91510: Fixed pump A17FNO, 250/300 bar
- RE 91520: Fixed pump A17FO, 300/350 bar
- RE 91540: 2-circuit fixed pump A18FDO, 350/400 bar
- RE 92260: Variable pump A17VO, 300/350 bar
- RE 92280: Variable pump A18VLO, 350/400 bar
General instructions

- The pump A18VO is designed to be used in open circuits.
- The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified personnel.
- Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, these can be requested from Bosch Rexroth.
- During and shortly after operation, there is a risk of burns on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e.g. by wearing protective clothing).
- Depending on the operating conditions of the axial piston unit (operating pressure, fluid temperature), the characteristic may shift.
- Service line ports:
  - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
  - The service line ports and function ports can only be used to accommodate hydraulic lines.
- The data and notes contained herein must be adhered to.
- Before finalizing your design, request a binding installation drawing.
- The product is not approved as a component for the safety concept of a general machine according to ISO 13849.
- Pressure controls are not backups against pressure overload. A pressure-relief valve is to be provided in the hydraulic system.
- The following tightening torques apply:
  - Fittings:
    Observe the manufacturer's instructions regarding the tightening torques of the fittings used.
  - Mounting bolts:
    For mounting bolts with metric ISO threads according to DIN 13, we recommend checking the tightening torque in individual cases in accordance with VDI 2230.
  - Female threads in the axial piston unit:
    The maximum permissible tightening torques $M_{G \text{ max}}$ are maximum values of the female threads and must not be exceeded. For values, see the following table.
  - Threaded plugs:
    For the metallic threaded plugs supplied with the axial piston unit, the required tightening torques of threaded plugs $M_v$ apply. For values, see the following table.

<table>

1) The tightening torques are valid for the delivery condition “dry” and for the installation-related, “lightly oiled” condition of the screw.
2) In the “lightly oiled” condition, the $M_v$ is reduced to 10 Nm for M10 x 1 and to 17 Nm for M12 x 1.5.
