

This event actually took place in Chicago in 1930. The Timken Company was trying to sell locomotive bearings to railroads, without much success. But after this demonstration, our bearings became standard on American locomotives as well as passenger train cars.

Today, Timken® bearings are moving trains around the globe. For over 80 years, the rail industry has turned to Timken to reduce friction and increase performance, and it's been full speed ahead ever since.

For more information, visit www.timken.com/rail.
