YOUR SPRAY SOLUTION

## Precision Spray Nozzles for Surface Technology

# Surface Technology

# INNOVATIVE NOZZLE TECHNOLOGY MAKES INNOVATIVE SURFACE TECHNOLOGY POSSIBLE

B

**Being successful means making the most of all opportunities that the market offers.**

**This also includes perfect production processes. Particular importance is attached here to increasing product quality and using more rational production methods. Nozzle and spraying technology offers many different, often surprisingly effective, possibilities of performing such tasks. Lechler can support you in mastering these tasks with an extraordinary potential in terms of experience, ideas and innovative technology.**

Whether we're checking the paint on a high-end sedan or how well a dishwasher works – surfaces make or break our first impression of product quality. Along with the quality aspect, surface characteristics are also decisive when it comes to function. One good example: the sophisticated pre-treatment steps in the PCB and photovoltaic industries. But no matter what the sector, all surface treatments include work steps such as cleaning, rinsing, drying, etching, or applying. To achieve optimum results, the required nozzles must be a perfect fit for the respective application.

This demands a high degree of expertise, as well as a broad range of suitable products. Additional knowledge and experience in surface technology applications is particularly helpful, as this simplifies the planning process and enable confident decision-making. What's more, Lechler carefully documents the performance data for all nozzle types – so you can easily access all relevant data in advance.

### Anything but superficial

Diligence and precision are especially important to success in surface treatment processes. That's why our experts will focus intensively on your task and will bring their expertise and specialist knowledge of the industry to find the best possible result in collaboration with you. At the same time you will benefit from 130 years of experience in the specialist field of nozzle and spraying technology.

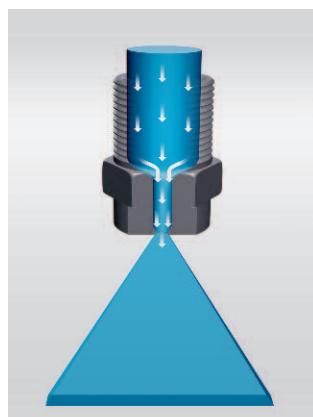

### Nozzles for surface treatment

In this brochure you will find Lechler products that are specially tailored to surface technology techniques and that have already proven themselves many times over. Due to their more complex production or smaller production runs, some of these nozzles command higher prices and have longer delivery times. You should bear this in mind in your deliberations and planning. The Lechler standard catalogue also offers you an extensive range of economical and readily available standard nozzles.

Nothing in our range that meets your needs? In that case, please let us know more about what you require so that we can talk to you about the possibility of developing a nozzle that is specially tailored to your needs.

You can rely on the practical experience of our application engineers who have proved their expertise in nozzles and

their knowledge of the trade, and have developed many solutions for optimising production processes.

Extensive know-how and excellent technical conditions allow exemplary results to be obtained time after time. Constant research and development work are your guarantee of future-proof solutions.

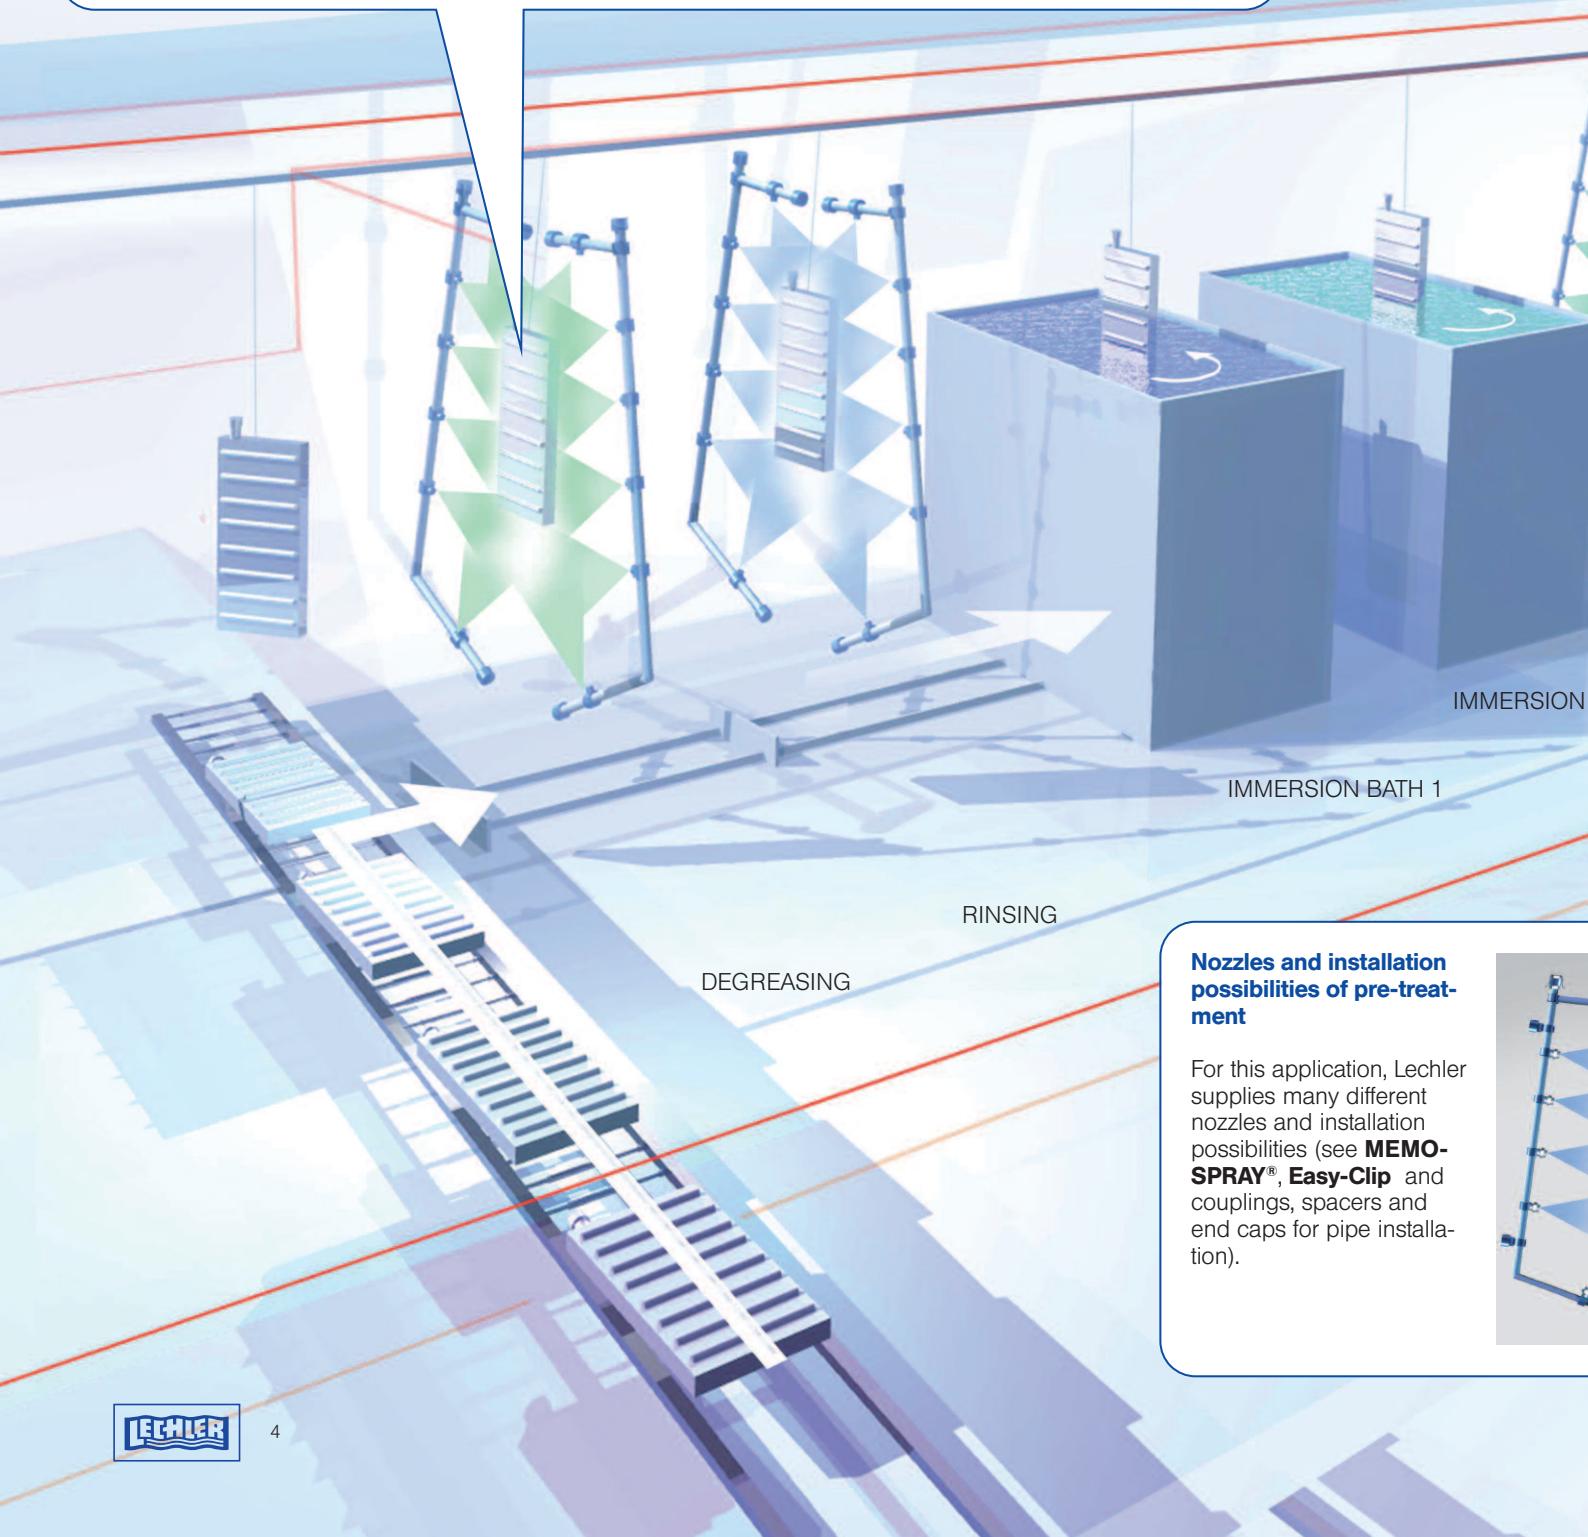

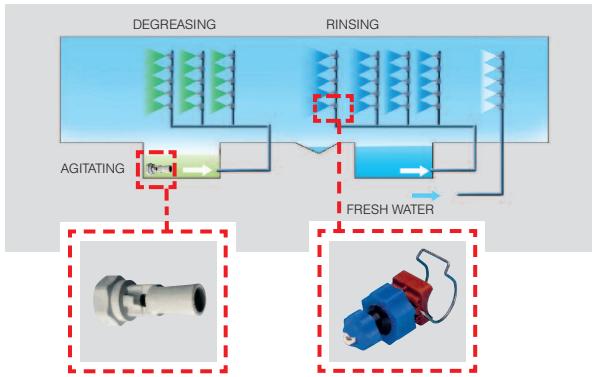

For detailed and clearly arranged information, visit our website at: [www.lechler.de](http://www.lechler.de)

# LECHLER NOZZLES ARE AN INTEGRAL COMPONENT IN PRE-TREATMENT AND PAINTING SYSTEMS

## Nozzles for water jet cleaning

In pre-treatment and painting systems, water jet cleaning is often employed as an automated process. **Flat fan nozzles and tongue-type nozzles with eyelet clamps** are the main variants used for this. The components pass through several process steps in which they are treated with various fluids. These include, for example, aqueous alkaline solutions and deionised water. **Eductor nozzles** are also used under water, the purpose of which is to prevent sedimentation.

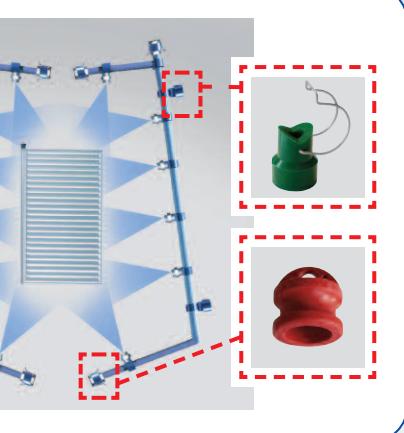

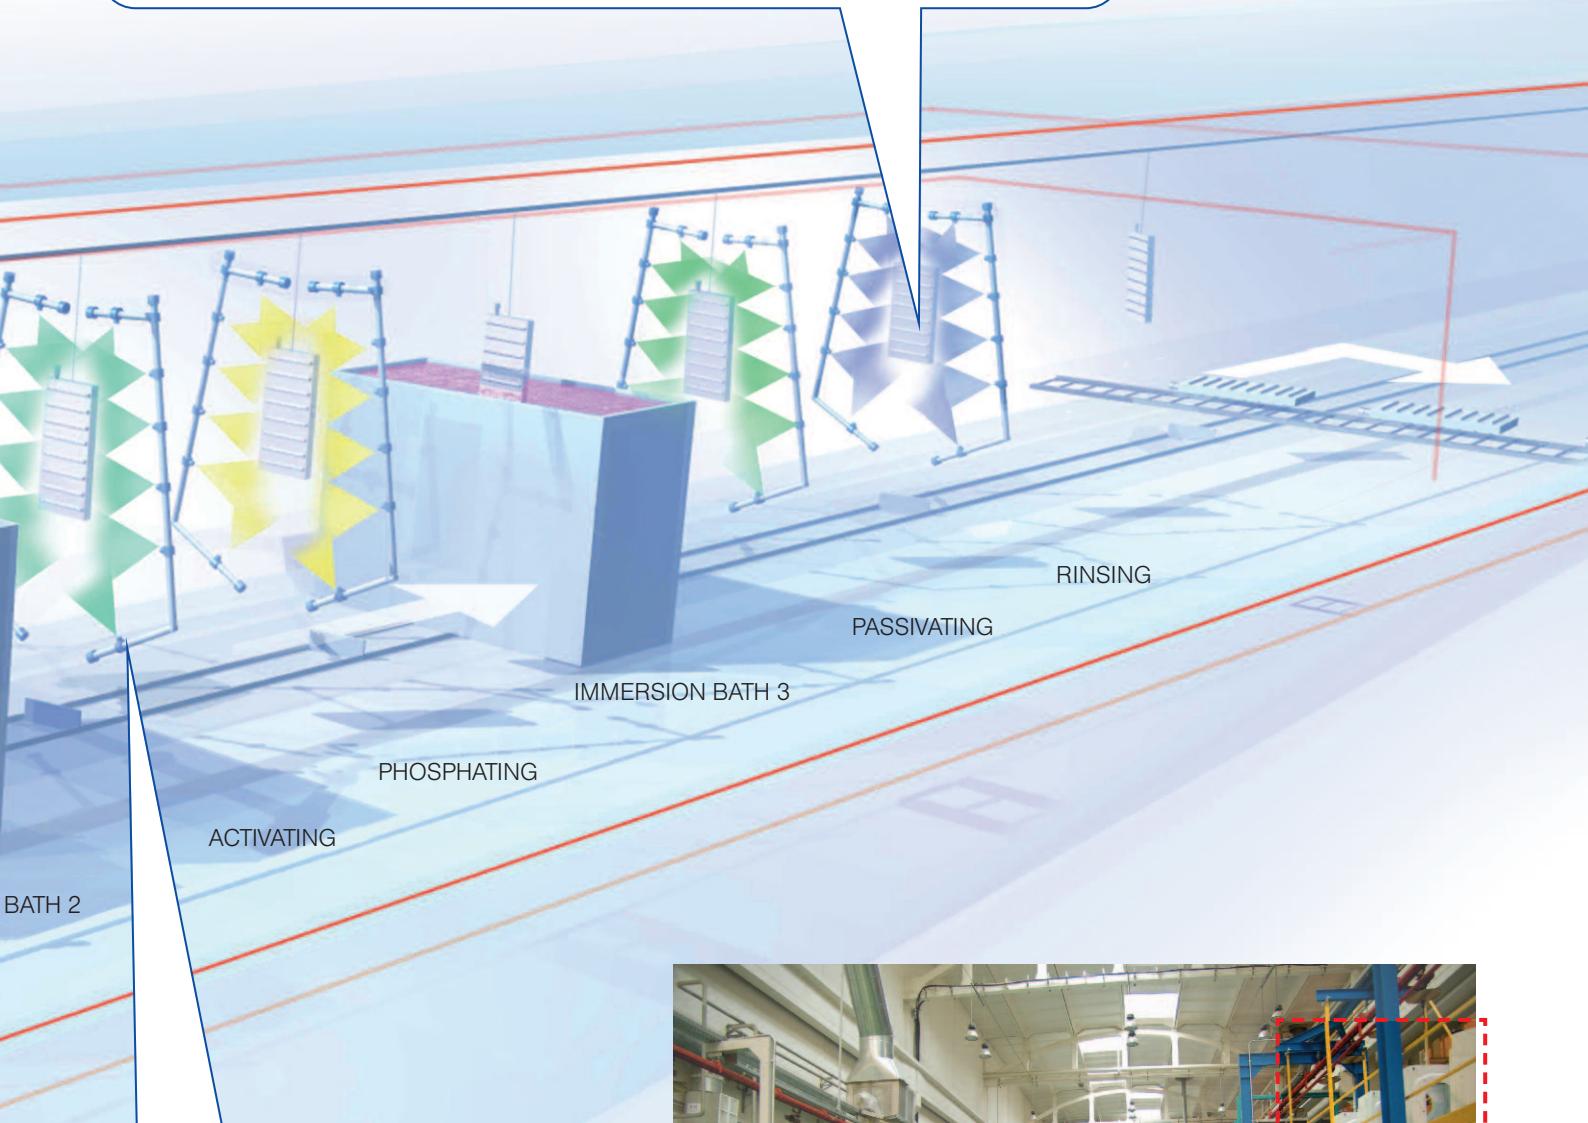

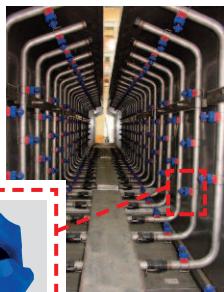

## Nozzles and installation possibilities of pre-treatment

For this application, Lechler supplies many different nozzles and installation possibilities (see **MEMO-SPRAY®**, **Easy-Clip** and couplings, spacers and end caps for pipe installation).

### Nozzles for the rinsing zone

At the end of a painting line, the components pass through a rinsing zone. There, surplus paint particles that are still mechanically attached are washed off. This is done according to the cascade principle, i.e. in several stages with increasingly clean rinsing agent until deionised water is used.

Example of a painting line for washing machine housings. On the left the component before painting, on the right the painting housing exits.

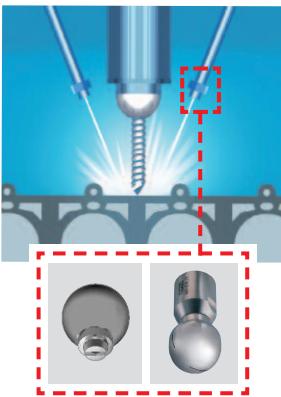

# LECHLER NOZZLES ARE USED IN MANY FIELDS IN THE AUTOMOTIVE INDUSTRY

## Areas of use from A to Z

- A** Aquaplaning test track spraying
- B** Blowing off dust
- C** Cooling of tools, cleaning of components and parts
- D** Degreasing, dust removal
- E** Electrophoresis washing pipes
- F** Filter cleaning, fire protection, fuel injection
- G** Gas treatment
- H** High pressure deburring and cleaning
- Impregnation
- J** Jet cutting
- L** Leak tests (car body leak test), lubrication
- M** Machining centre cleaning
- N** NOx removal
- P** Phosphate treatment
- Q** Quenching
- R** Rain and fog simulation, rain curtains
- S** Salt mist tests (corrosion tests)
- T** Tank cleaning, temperature control
- U** Underbody cleaning
- W** Wet zone with demineralized water, washing between zones
- Z** Zone cleaning (paint spray lines)

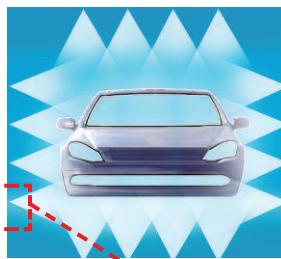

### Nozzles for tool cooling, tool lubrication and chip removal

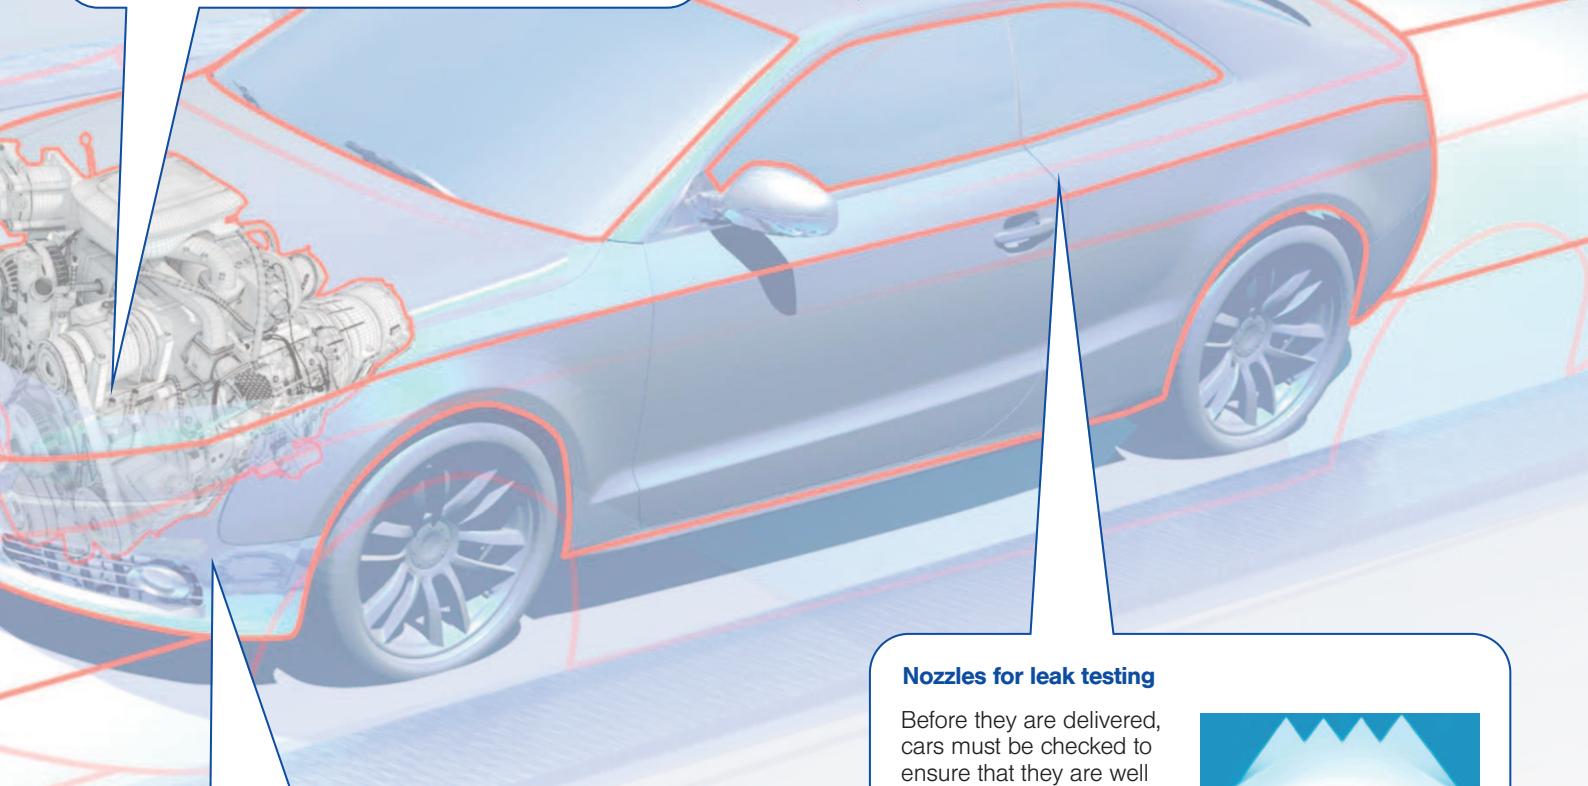

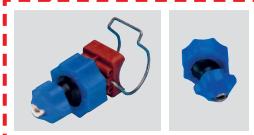

For this task it is crucial that the nozzles spray in the correct location so that the best cooling or lubrication effect is achieved. **Series 676 nozzles** (for example) provide the possibility of adjustment with the aid of a ball joint. In CNC machining centres, **tank cleaning nozzles** that clean the machine's entire interior are also used for chip removal.

### Nozzles for surface pre-treatment

Flat fan nozzles are typically used in many stages of automobile pre-treatment. The **MEMOSPRAY®** and **Easy-Clip** nozzle systems are particularly common.

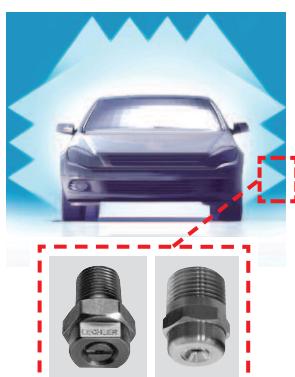

### Nozzles for use in washing installations

In this application it is crucial that the nozzles spray in the correct location. Lechler offers a wide range of different **flat fan nozzles**. These also include **high-pressure nozzles** and **tongue-type nozzles**. Selecting the correct nozzle enables the cleaning result and water consumption to be balanced.

### Nozzles for leak testing

Before they are delivered, cars must be checked to ensure that they are well sealed against rain and moisture. This involves spraying them from all sides using **full cone** and **flat fan nozzles**. Here the rain intensity settings range from gentle rain have to pass through a car wash.

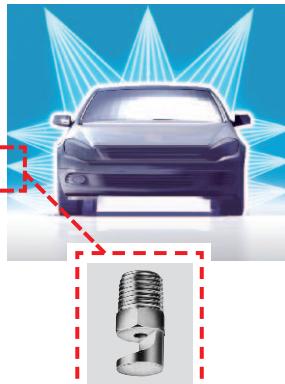

# CLEANING SYSTEMS ARE FITTED WITH LECHLER FLAT FAN AND TONGUE-TYPE NOZZLES

## Nozzles for the pre-wash

The purpose of the pre-wash is to soften the soil.

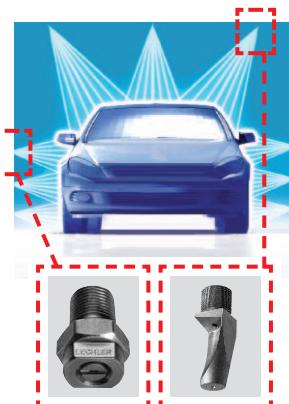

**Flat fan nozzles** or **tongue-type nozzles** with a wide spray angle and a low flow rate are preferred.

## Nozzles for the main wash

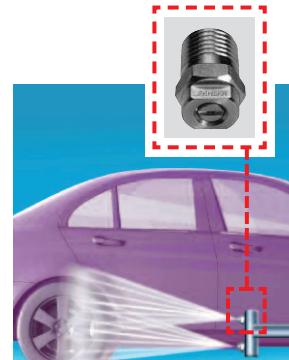

The main wash requires high-impact flat fan nozzles or tongue-type nozzles. The spray angle should be 30 to 45 degrees. Their sharp jet means that tongue-type nozzles are ideally suited to the low pressure.

**High-pressure flat fan nozzles** differ from low-pressure nozzles by virtue of their hardened nozzle mouthpiece, which gives these nozzles a longer service life.

## Nozzles for sill and wheel washing

The lower third of the vehicle is mostly where soil is found (e.g. impacted insects). A high impact is crucial to removing this type of soil. We recommend **high-pressure nozzles** with a narrow spray angle.

### Nozzles for applying wax

Wax should be applied as evenly as possible. This requires a defined nozzle arrangement. For this we recommend our **series 652** in conjunction with a retaining nut and eyelet clamp.

Manifolds fitted with this series distribute the water very evenly.

### Nozzles for rinsing

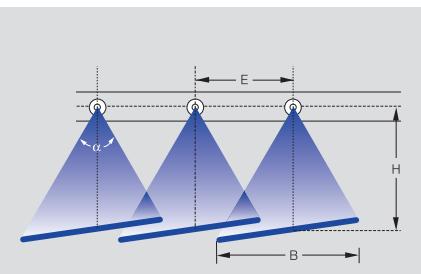

Rinsing is the last stage before drying. This requires small droplets that run off the vehicle quickly. **Flat fan nozzles** with a very low flow rate are used in most cases.

The nozzles are easy to align in conjunction with a **bayonet cap** and a **ball joint**.

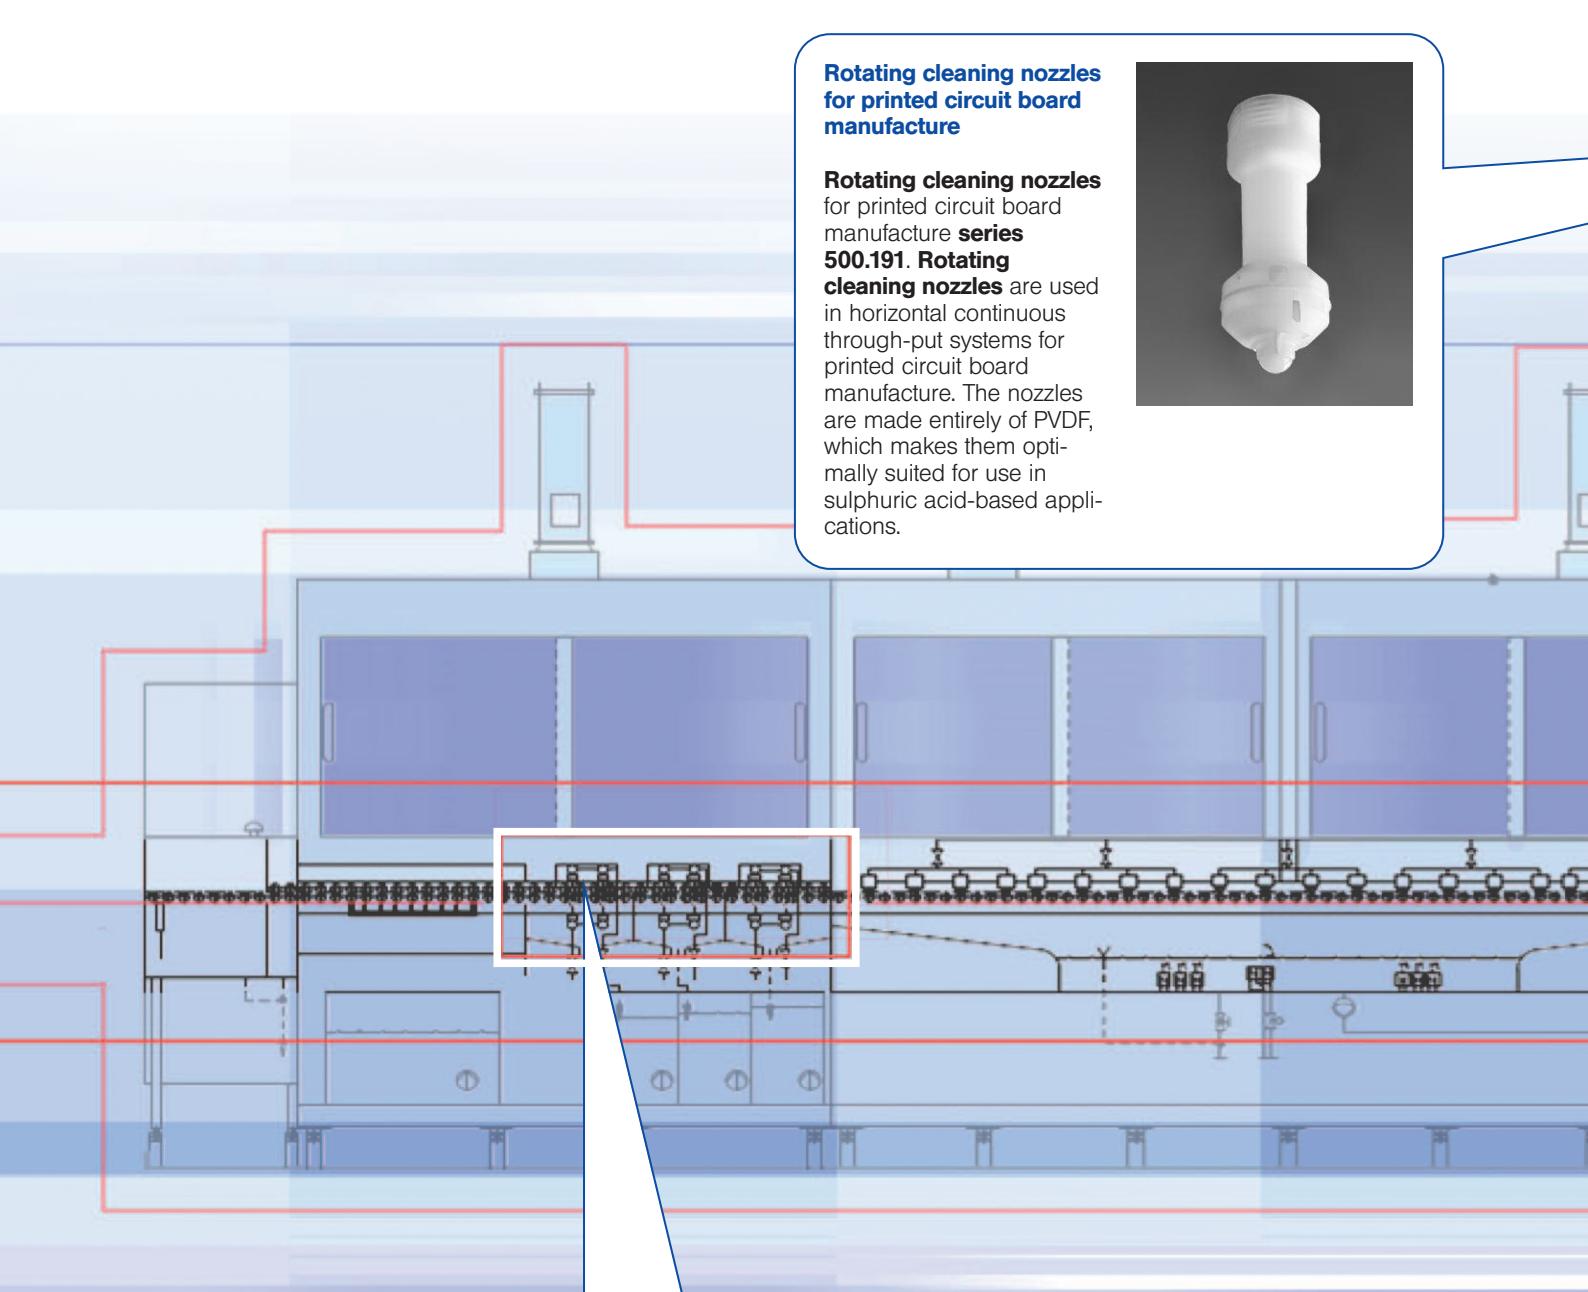

### Arrangement of low-pressure flat fan nozzles

Lechler **flat fan nozzles** give you a linear impact with even droplet application. A prerequisite for this is that the spray widths **B** overlap by approximately 1/3–1/4. Here the nozzles should be aligned approximately 5–15° to the pipe's longitudinal axis in order to prevent the sprays from being interrupted.

# LECHLER NOZZLES ARE USED IN MANY FIELDS IN THE PHOTOVOLTAIC AND PRINTED CIRCUIT BOARDS INDUSTRY

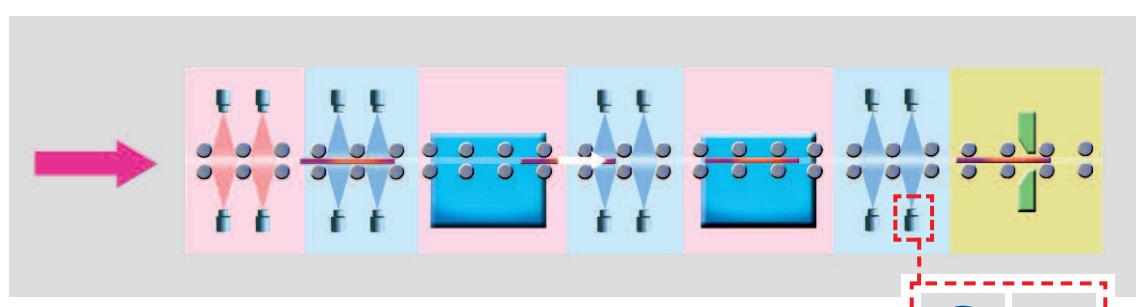

## Rotating cleaning nozzles for printed circuit board manufacture

### Rotating cleaning nozzles for printed circuit board manufacture series

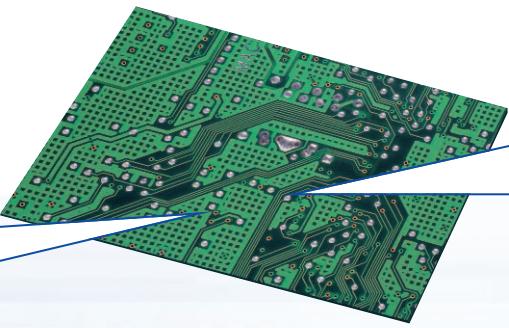

**500.191. Rotating  
cleaning nozzles** are used  
in horizontal continuous  
through-put systems for  
printed circuit board  
manufacture. The nozzles  
are made entirely of PVDF,  
which makes them optimally  
suited for use in  
sulphuric acid-based appli-  
cations.

## Nozzles for alkaline texturing

Flat fan nozzles in several series-connected modules are used in this process. Nozzles made of PVDF are preferred, because they are resistant to the chemicals used.

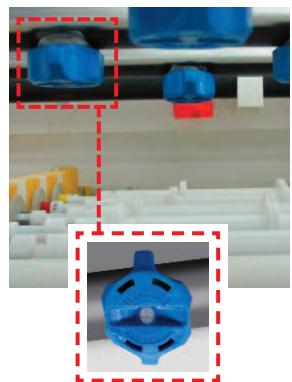

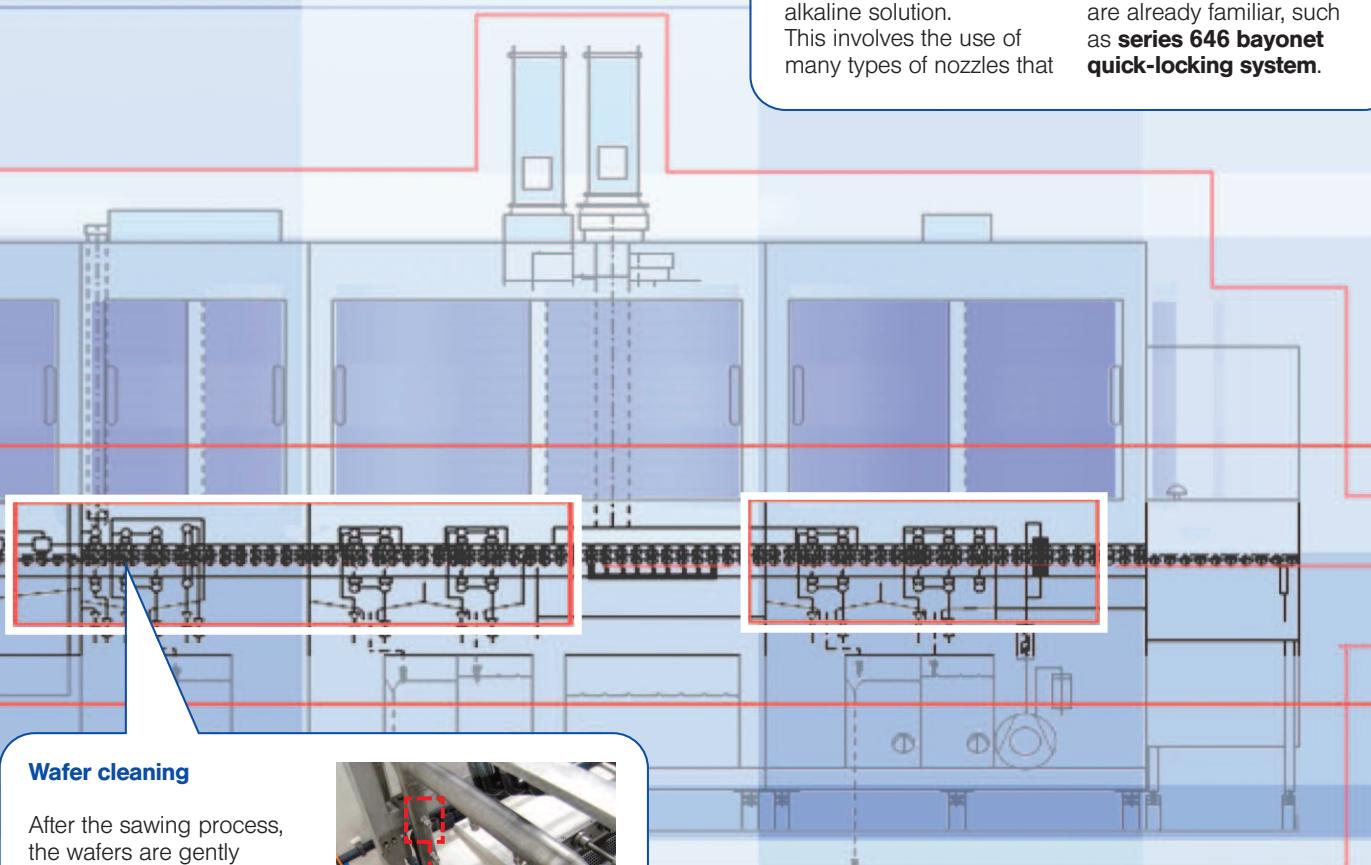

### Circuit board manufacturing

Developing, etching, stripping. In a typical inner layer line for manufacturing circuit boards, the resist is developed in the developer, the bare copper is sprayed with an acidic etching solution in the etching module and is removed down to the base material, and the resist is stripped off by using an alkaline solution.

This involves the use of many types of nozzles that

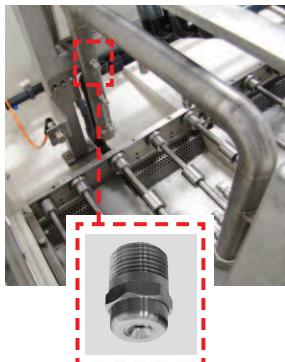

are already familiar, such as **series 646 bayonet quick-locking system**.

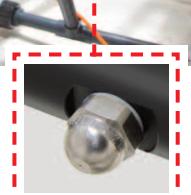

### Wafer cleaning

After the sawing process, the wafers are gently cleaned with **full cone nozzles**. The cleaning medium is sprayed onto the individual wafers, thereby achieving a homogeneous cleaning result across the entire surface.

### Nozzles for wafer moistening

After the sawing process, the wafers are moistened with hollow cone nozzles. **Hollow cone nozzles** produce a fine spray mist that settles on the wafers. This ensures that no impurities dry onto the wafer, thereby also ensuring an efficient wafer production process.

# PART CLEANING WITH LECHLER FLAT FAN NOZZLES AND TONGUE-TYPE NOZZLES

## Cleaning engine pistons

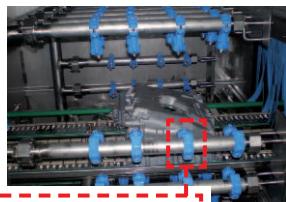

Dual-lane continuous cyclic cleaning system for cleaning aluminium engine pistons. Increasing volumes require efficient and reliable nozzles. **Series 612 nozzles** can be used if only a small installation space is available at the same time.

## Oil sump cleaning

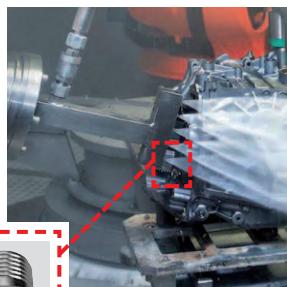

Continuous cleaning system for aluminium oil sumps, four-sided spraying.

**Simple installation and quick replacement of nozzles** enable the system's maintenance costs to be reduced.

## Deburring

High-pressure water jet-deburring aided by a robot. A notable feature of **flat jet nozzles** is a very shallow jet depth, giving them a particularly high cleaning effect.

# PROFESSIONAL RINSING TECHNOLOGY WITH LECHLER NOZZLES

## Cleaning oven racks

Washing system for cleaning oven racks used in bakeries, for example. **Series 612 PVDF flat fan nozzles for pressing into pipes** and **series 632 stainless steel flat fan nozzles with a retaining nut and eyelet clamp** are used to spray the cleaner onto the racks in foam form. The nozzles are used for rinsing clean in a downstream process.

## Conveyor belt dishwashers

Lechler **series 612 PVDF flat fan nozzles for pressing into pipes** are used for fresh-water rinsing in conveyor belt dishwashers in order to remove any remaining suds from the objects being washed. This requires homogenous water distribution in order to achieve an optimum and constant cleaning result.

# WHAT YOU SHOULD KEEP IN MIND WHEN PLANNING

The most important criteria that must be taken into account when selecting nozzles are listed below.

## ① Impact

The force of impact when using a liquid jet on a surface plays an important role in surface technology. The ratio of the force (F) to the surface (A) is referred to as the impact (I).

$$I = \frac{\text{Impact force}}{\text{Impact surface}} = \frac{F}{A} \left[ \frac{\text{N}}{\text{m}^2} \right]$$

The following explains the parameters with which the impact can be influenced.

### Impact surface and spray angle

The impact surface is the area where the droplet strikes. The smaller the surface area, the greater the impact values. Nozzles with high impact are, for example, solid stream nozzles and flat fan nozzles with a narrow spray angle.

### Pressure

Increasing the connected pressure results in an increase in the spray impact. Doubling the pressure while maintaining the same flow rate results in a doubling of the impact.

### Flow rate

Increasing the flow rate by using a larger nozzle increases the impact, assuming that the other parameters (spray angle, pressure and medium) remain the same.

## Nozzle selection criteria:

### ① Impact

- Impact surface and jet shape
- Spraying distance
- Pressure
- Flow rate
- Jet depth

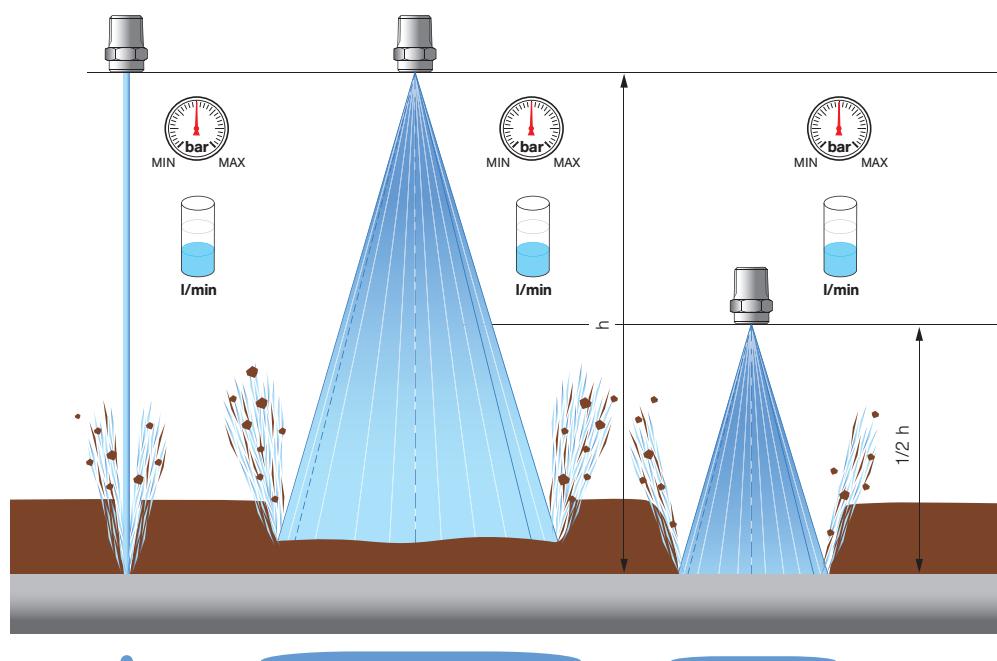

### ② Spray angle and spraying behaviour

### ③ Liquid distribution

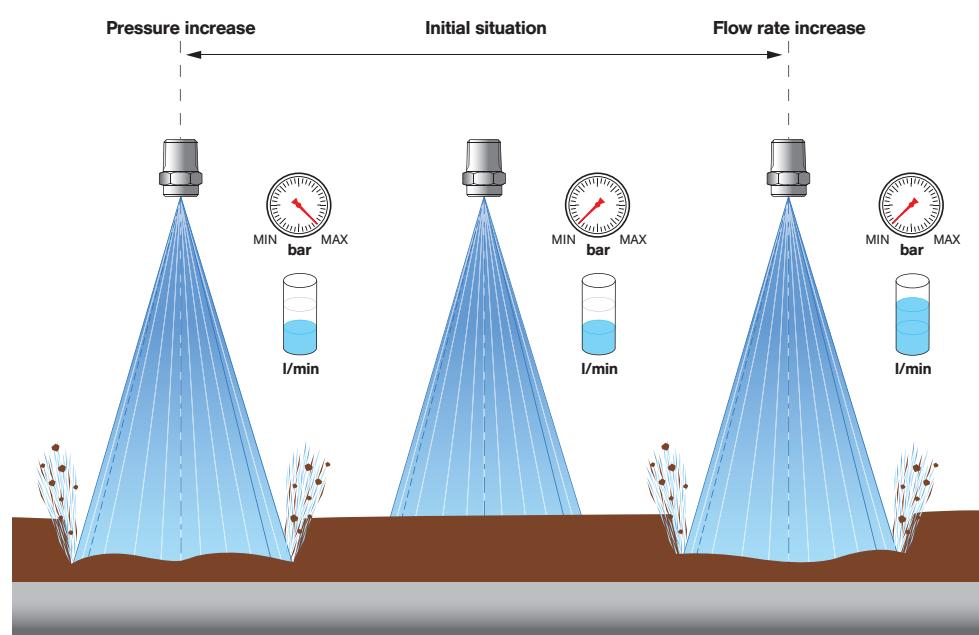

### ④ Droplet sizes

### ⑤ Factors influencing the temperature behaviour of nozzle materials

### ⑥ Material and wear

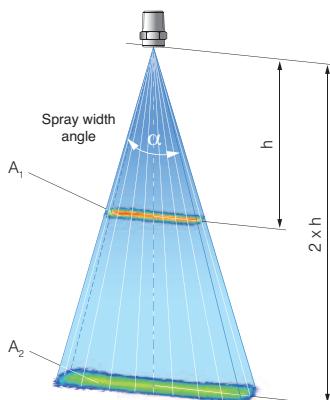

Comparison of the cleaning result of three nozzles with identical pressure and flow rate.

Comparison of the cleaning result of three nozzles with pressure or flow rate increase.

## Spraying distance (vertical distance to the nozzle)

With a flat fan nozzle, doubling the distance would ideally result in a quadrupling of the surface area sprayed.

Theoretically, for atomization nozzles, the greater the distance the greater also the surface area sprayed, resulting in the impact being reduced accordingly.

The spray angle and jet depth ensure that the sprayed surface area becomes larger as the spraying distance increases.

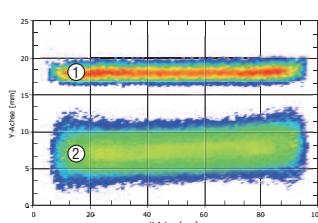

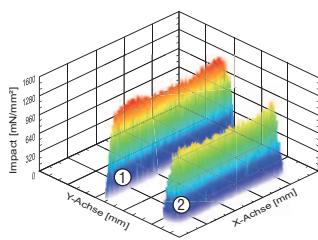

In theory, the following applies to flat fan nozzles: If the spraying distance is doubled, the sprayed surface area quadruples. Consequently, the impact decreases four-fold.

| Distance | Area     | Impact   |
|----------|----------|----------|
| h        | A        | I        |
| 1.5 x h  | 2.25 x A | I / 2.25 |
| 2 x h    | 4 x A    | I / 4    |
| 3 x h    | 9 x A    | I / 9    |
| 4 x h    | 16 x A   | I / 16   |

## Spray depth

When flat fan nozzles are used, the impact that can be achieved depends greatly on the quality of the spray. For example, using special jet geometries (Lechler high-pressure flat fan nozzles) or a high flow quality, a narrower spray depth can be obtained.

Assuming that the other parameters (pressure, flow rate, spray angle and medium) remain the same, a narrower spray depth results in a higher impact.

Comparison of the spray depth of a high-pressure flat fan nozzle ① with a standard flat fan nozzle ②

## ② Spray angle and spraying behaviour

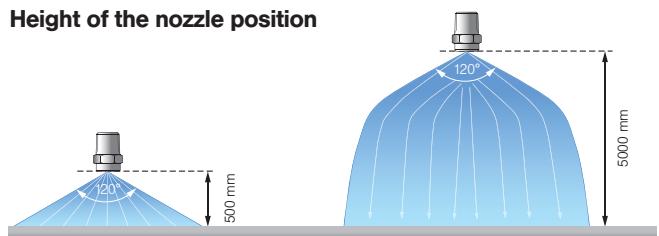

Depending on the version and job, single-fluid nozzles are available with differently stepped spray angles from 0° (solid jet nozzles) to 360° (tank-cleaning nozzles). The spray angles quoted by Lechler apply close to the nozzle and in a still atmosphere. Gravity and flow processes in the ambient atmosphere alter the spray pattern. Depending on the version, single-fluid nozzles can spray the liquid as a hollow cone, full cone or flat fan.

The solid jet nozzle does not spray, but rather produces a closed jet that hits at a concentrated point.

The jet only begins to break up after some distance.

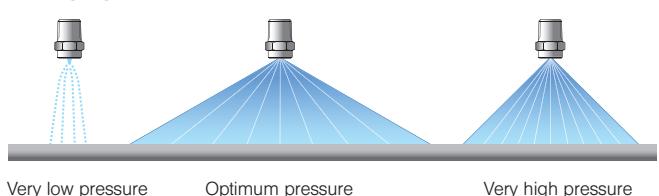

Twin-fluid nozzles have a narrow spray angle of approximately 20° due to the high speed at which the compressible medium exits. However, as the distance from the nozzle increases, the spray pattern becomes increasingly less sharply defined. Twin-fluid nozzles normally produce full cone or flat fan spray patterns, and some versions can be changed over accordingly.

## Height of the nozzle position

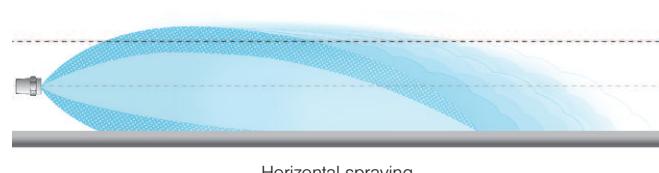

The diagram above illustrates how height influences the spray pattern.

## Changing the nozzle pressure

## Spraying direction

# WHAT YOU SHOULD KEEP IN MIND WHEN PLANNING

## ③ Liquid distribution

In coating processes, for example, it is attached to the homogenous distribution of the sprayed liquid. In order to obtain an even liquid distribution, several nozzles must be arranged next to each other because one nozzle alone would produce a parabolic liquid distribution as standard. The arrangement of several nozzles enables an almost even distribution to be obtained by overlapping.

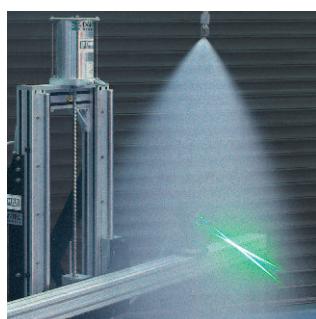

## Measuring the distribution

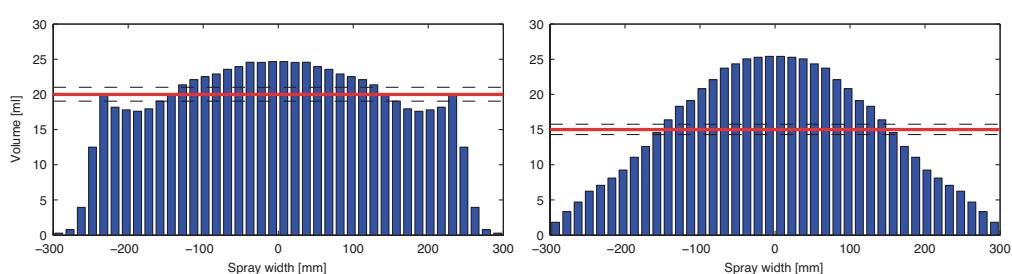

The liquid distribution in a measuring plane is determined by collecting the volume of liquid in a combination of Plexiglas cylinders. The filling level of the individual cylinders is determined completely automatic. This measuring process is also suitable for recording the liquid distribution of a nozzle across a moving measuring plane. This enables conveyor belt spraying to be simulated, for example.

## ④ Droplet sizes

Twin-fluid nozzles can produce very fine to extremely fine droplets, this being mainly dependent on the flow rate ratio of the compressible medium being used ( $\text{m}^3/\text{h}$ ) to the atomized liquid (l/min). The greater this ratio, the finer the atomization. In the case of single-fluid nozzles, the droplet spectrum is determined primarily by the pressure, the nozzle design and the flow rate. Increasing pressure results in finer atomization, but mostly only up to a certain level.

Provided that the pressure and flow rate are the same, hollow cone nozzles produce very fine to fine droplets, full cone nozzles produce somewhat coarser droplet spectra and flat fan nozzles have the coarsest droplet spectrum. If we compare nozzles of one series at a particular pressure, nozzles with a lower flow rate produce finer droplet spectra than nozzles with a higher flow rate.

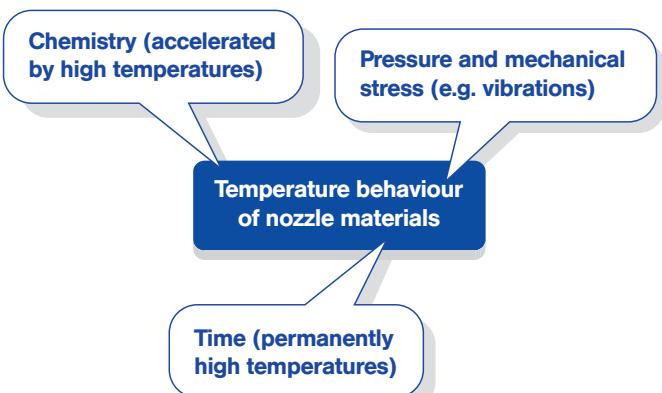

Liquid distribution of a Lechler high-pressure flat fan nozzle.

## ⑤ Factors that influence the temperature behaviour of nozzle materials

A distinction must be made here between low-temperature behaviour and high-temperature behaviour. Applications with temperatures up to 140°C are very common, because this is the range within which for example most cleaning applications and sterilisation processes fall. Applications with higher temperatures are rare, and applications at very low temperatures are even more rare.

The general temperature information from material data sheets must always be scrutinised for every single

case of nozzle use. The main factors that influence the suitability of a nozzle material at higher temperatures are: Pressure and the associated mechanical stress type along with chemistry and time. Chemical processes can be more aggressive at high temperatures. A material may be able to withstand them if this temperature occurs for a short period only. In all materials, high temperatures result in reduced strength values. The mechanical stress type must therefore also be taken into account in high-pressure applications, in particular. In addition, vibrations in the system can cause premature failure.

Liquid distribution of a Lechler standard flat fan nozzle.

## ⑥ Material and wear

Nozzle wear depends primarily on the conditions of use and the nozzle material. Normally, the nozzle's liquid discharge opening wears as a result of material abrasion. The following conditions of use can speed up wear:

- Operating the nozzle above the recommended pressure range
- Solids in the liquid and also hard particles
- The use of chemically aggressive substances (see figure)

The nozzle body can also wear from the outside if the nozzle is used in a harmful environment (corrosive gases, radiation, temperature).

The diagram below shows the factors that influence nozzle wear.

### Signs of nozzle wear

Nozzle wear becomes apparent from a noticeable increase in flow rate. The cause of this is the enlarged cross section of the liquid opening that results from material abrasion. This means that if a pressure is permanently set, more liquid is discharged than it was originally intended. The result of this is higher fresh water and waste water costs. Fig. 1 shows an example of a heavily corroded spray ball.

**Fig. 1:** Chemical corrosion of a spray ball

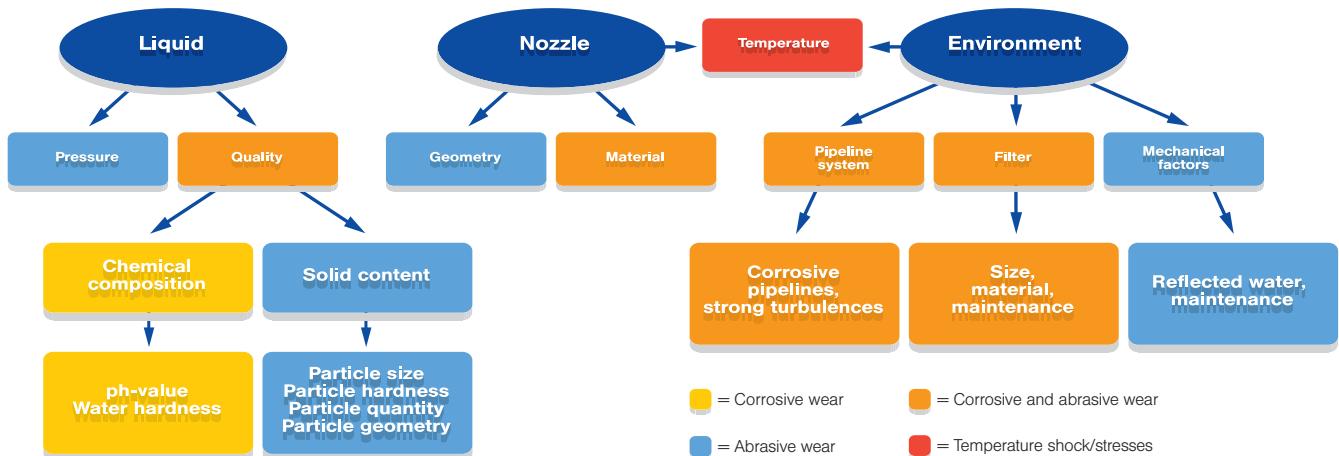

**Fig. 2:** Wear of a full cone nozzle

### Material wear

In most cases, excessive wear can be counteracted by selecting a different material. One of the most common cases is the atomization of a liquid with a solid component. Such particle-laden liquids cause significant wear if the particles have a greater hardness than the nozzle material (Fig. 2). The table shows different materials and their average Vickers hardness.

The values are for the purpose of rough estimates only.

| Nozzle material            | Vickers hardness (HV) |
|----------------------------|-----------------------|
| Aluminium                  | ~ 80                  |
| Brass                      | 80–150                |
| Titanium (grade 1 to 4)    | 125–210               |
| Hastelloy®                 | 200–250               |
| Stainless steel            | 220–270               |
| Stainless steel (hardened) | 390–690               |
| Carbide                    | 1000–2300             |
| Ceramic                    | 1500–2700             |
| Sapphire/ruby              | ~ 2300                |

Factors that influence nozzle wear.

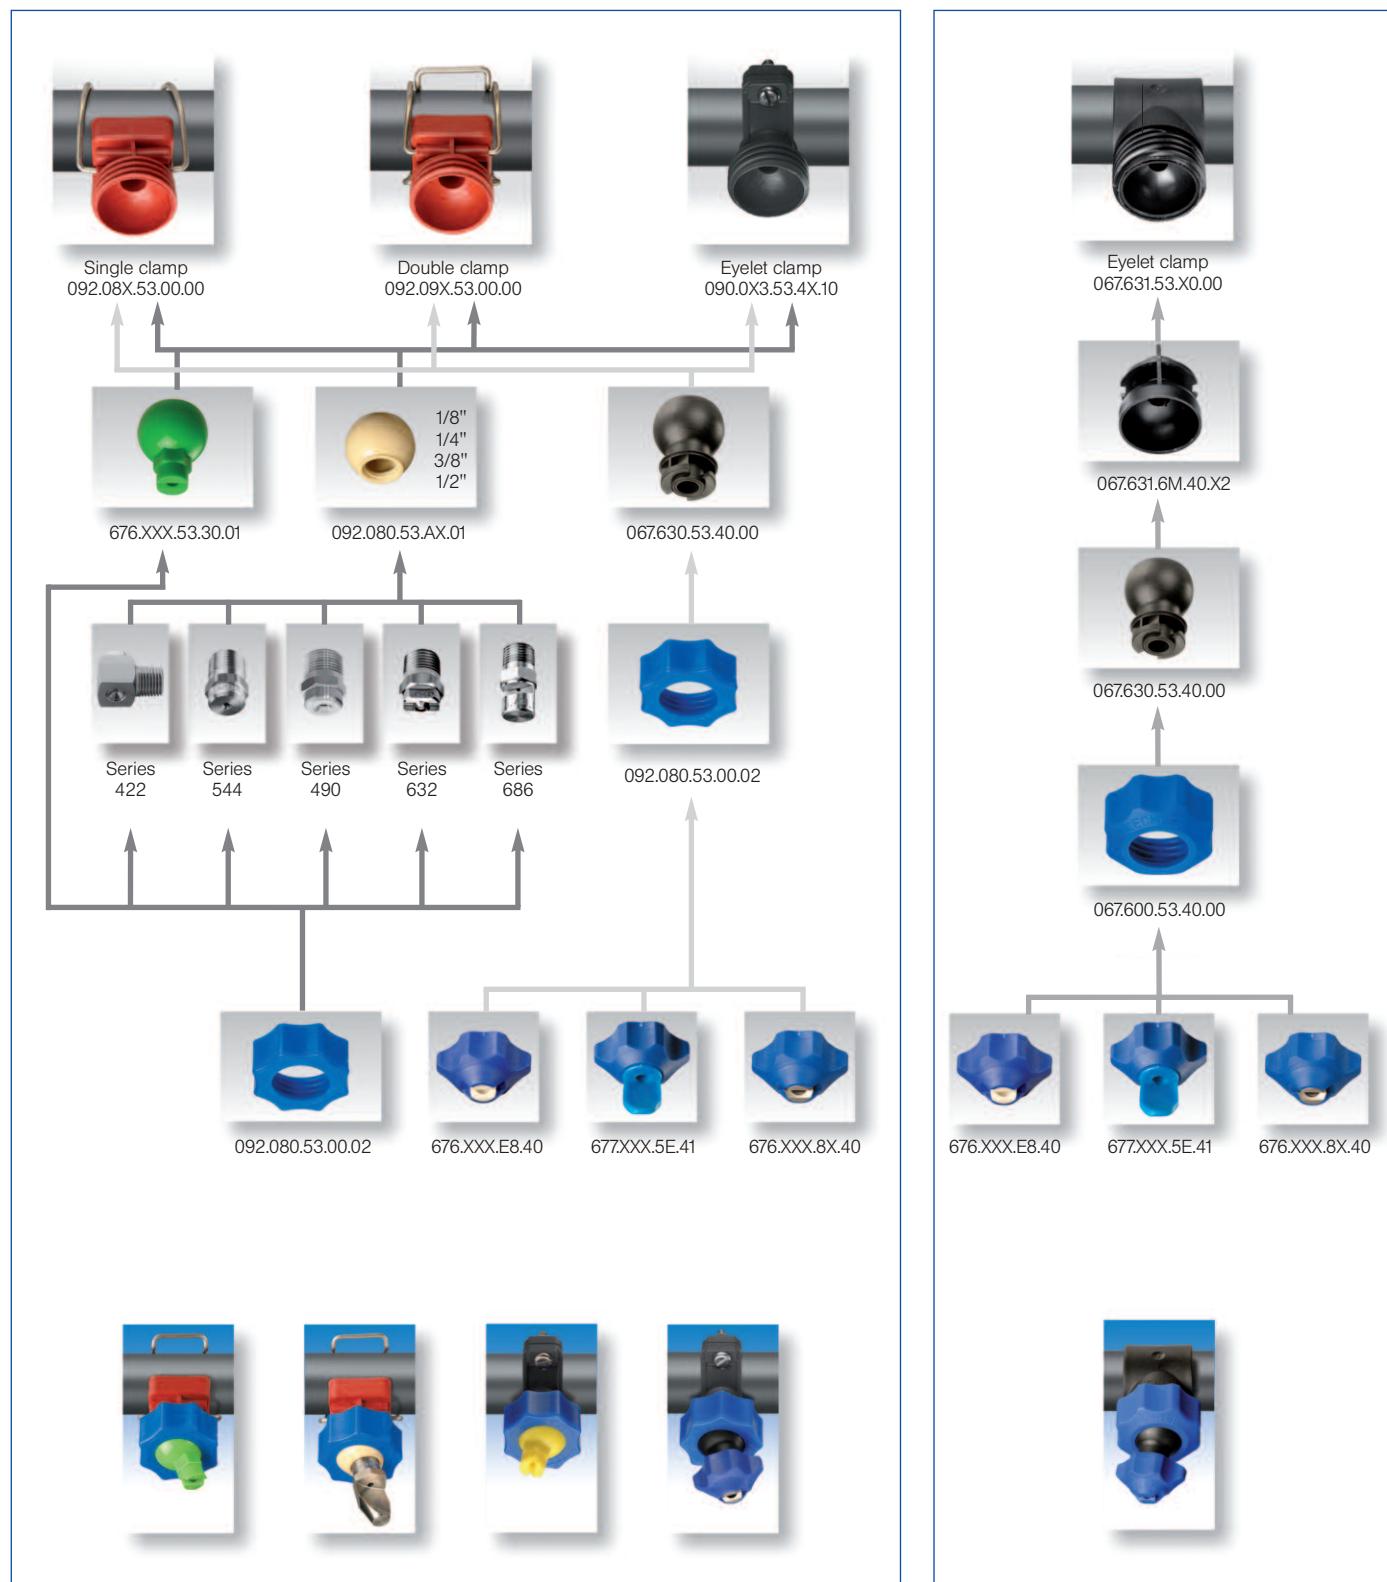

## Nozzle systems for surface treatment

### MEMOSPRAY®/Easy-Clip

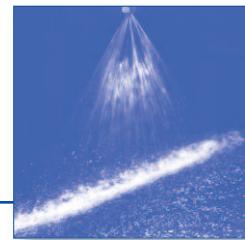

### MEMOSPRAY®/Easy-Clip combination

# Nozzle systems for surface technology

## MEMOSPRAY® nozzle system

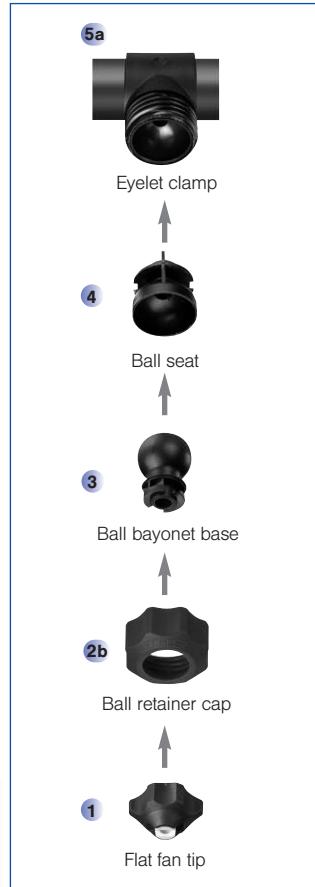

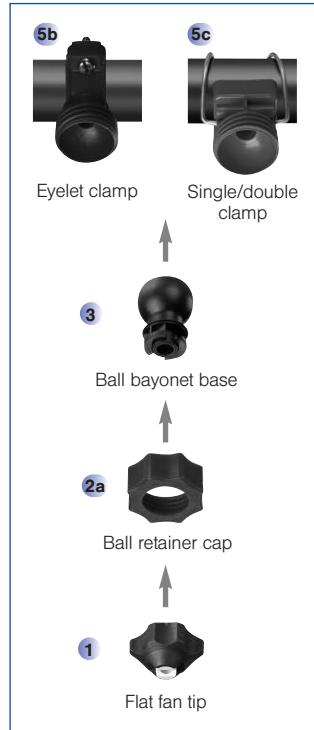

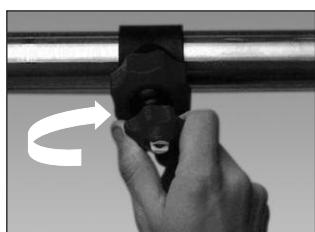

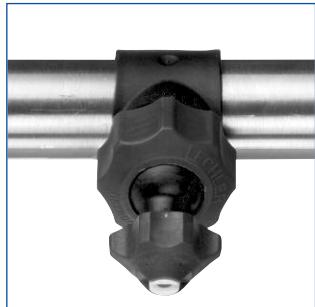

**Maintaining of the adjusted spray direction by the »memory effect«. Very easy handling without the need for special tools.**

**Especially pressure resistant pipe connector.**

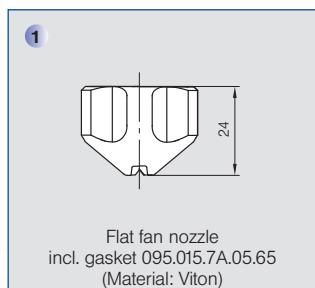

Application:

Degreasing, phosphating in surface treatment, cleaning.

## Nozzle systems for surface treatment

### Easy-Clip nozzle system

**Quick and easy assembly with clamp. No tools required.**  
**Allround swivelling by 30°.**  
**Easy adjustment and cleaning.**

**Applications:**  
 Degreasing, phosphating  
 in surface treatment.

**Materials:**  
 Clamp: Stainless steel 301 SS  
 Sealing: EPDM  
 Cylinder pin, screw and screw unit: 316 SS.  
 Body, ball retainer cap: PP,  
 reinforced.  
 Nozzle, ball joint: PP

## Sets

**Existing of**  
**■ Nozzle**  
**■ Single clamp for 1 1/4" pipe**  
**■ Ball retainer cap**

## Flat fan nozzles

## **Series 632/633**

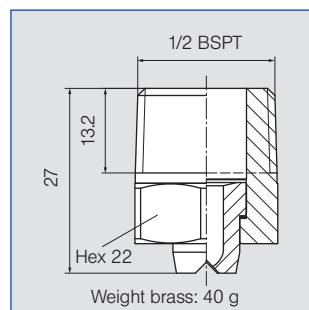

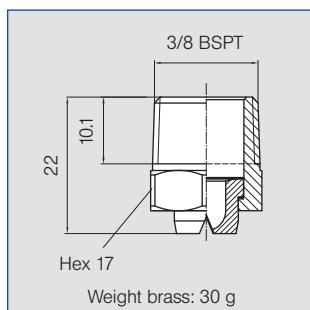

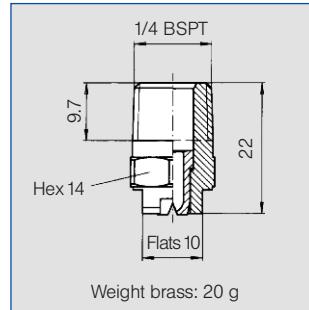

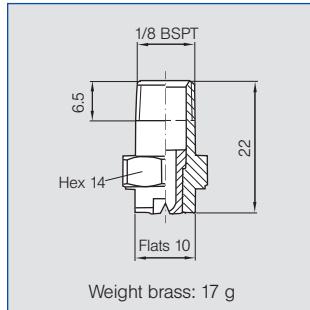

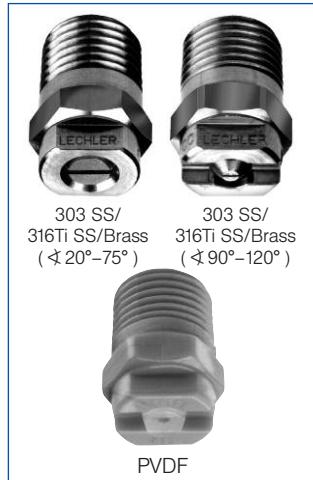

**Standard design with high-precision spray angle, exact flow rate, and extremely narrow spray depth, achieved through close manufacturing tolerances. This makes the series suitable for even complex cleaning tasks. Parabolic distribution of liquid ensures that spray pipes equipped with these nozzles show an extremely uniform total liquid distribution.**

**Conical, self-sealing thread connection.** The entire product range is available at short notice, due to the modular design.

### **Applications:**

Spray cleaning, surface treatment, filter cleaning, belt cleaning, lubricating, coating.

Example    Type + Material no. + Code = Ordering no.  
for ordering: 632.303. + 16 + CA = 632.303.16.CA

Conversion formula for the above series:  $\dot{V}_2 = \dot{V}_1 * \sqrt{\frac{p_2}{p_1}}$

## Flat fan nozzles

## Flat fan nozzles

### Series 650/651

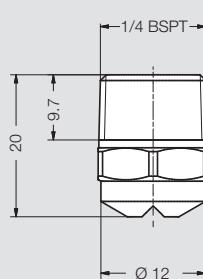

**Cost-efficient design for standard cleaning tasks and rinsing processes. Series with uniform flat fan and conical, self-sealing thread connection. Suitable for use with spray pipes. Manufactured to order in quantities 250 or greater.**

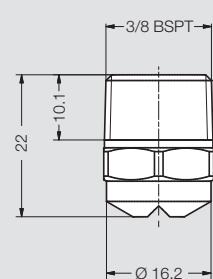

Application: Standard cleaning and rinsing tasks

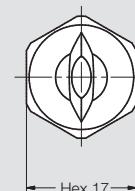

Weight: approx. 70 g

Weight: approx. 150 g

Weight: approx. 260 g

A = equivalent bore diameter · E = narrowest free cross section

\* Differing spray pattern

Subject to technical modifications.

Continued on next page.

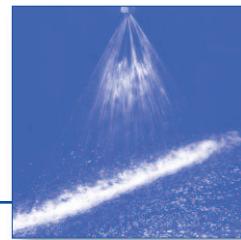

Example      Type      + Material no.      + Code = Ordering no.  
for ordering:    650.483    + 1C                + CA    = 650.483.1C.CA

Conversion formula for the above series:  $\dot{V}_2 = \dot{V}_1 * \sqrt{\frac{p_2}{p_1}}$

## Flat fan nozzles

## Flat fan nozzles for retaining nut

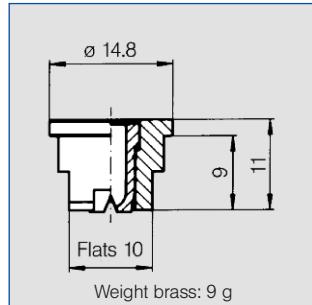

### Series 652

**Assembly with retaining nut.**  
**Easy nozzle changing, simple jet alignment. Uniform, parabolic distribution of liquid.**  
**Spray pipes equipped with these nozzles show an extremely uniform total liquid distribution.**

#### Applications:

Spray cleaning, surface treatment, filter cleaning, belt cleaning, lubricating, coating.

## Flat fan nozzles with ball joint

### Series 676

**Swivelling nozzle for precise adjusting of jet direction.  
No gaskets necessary.  
Long, unproblematic service life.**

Applications:  
Cleaning, cooling, lubricating.

## Flat fan nozzles with bayonet quick release cap Series 646

**Quick and easy assembly  
with bayonet quick release  
cap. Adjusted spray direction.  
Uniform liquid distribution.**

Applications:  
Belt cleaning, surface  
treatment, cleaning, coating  
processes.

Conversion formula for the above series:  $\dot{V}_2 = \dot{V}_1 * \sqrt{\frac{p_2}{p_1}}$

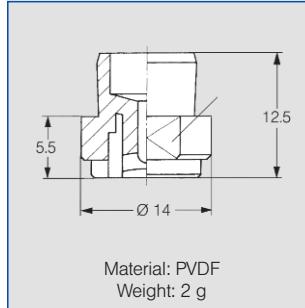

## Flat fan nozzles for pressing into pipes

### Series 612. XXX. 5E. 03

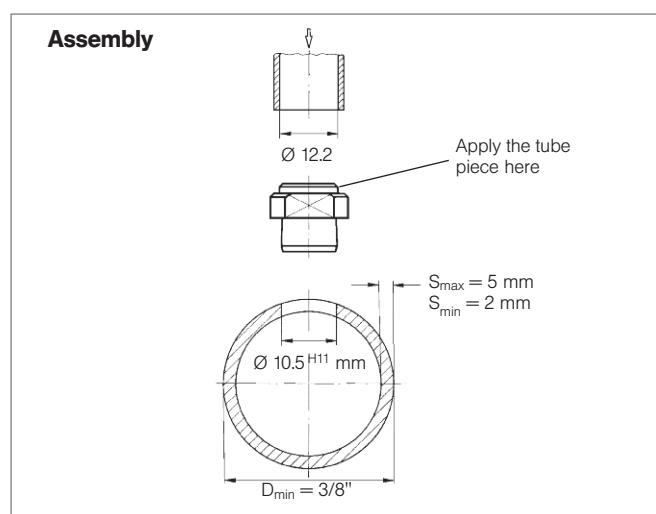

**For pressing into pipes.**  
**Stable spray pattern.**  
**Uniform, parabolic distribution of liquid.**  
 Applications:  
 Cleaning and rinsing, dish washing.

A = equivalent bore diameter · E = narrowest free cross section

Further nozzle sizes on request.

**Assembly:**  
 Drill pipe ( $\varnothing 10$  mm), ream to  $\varnothing 10.5^{H11}$  mm, adjust, put tube ( $\varnothing 12.2$  mm) on nozzle and drive in with a rubber mallet. Flow velocity in the pipe max. 2–3 m/s.

Example      Type      +      Material no.      =      Ordering no.  
 for ordering:    612. 366    +    5E. 03    =    612. 366. 5E. 03

#### Flat fan nozzle for pressing into pipes with stainless steel insert

Flow rate range  
 0.05–4.00 l/min at 2 bar.

Available on request.

#### Full cone nozzle for pressing into pipes

Flow rate range  
 1.6 l/min at 2 bar.

Spray angle 60°.

Available on request.

## High pressure flat fan nozzles

### Series 602/608/652

**Sharp uniform flat fan with an extremely narrow jet depth.**

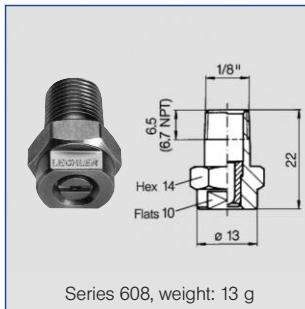

Applications:

High pressure cleaners, steam jet cleaners

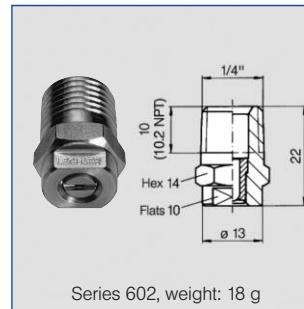

Materials:

Nozzle body: 303 SS

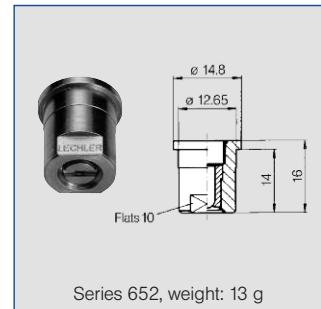

Insert: Hardened stainless steel 420F SS

Series 608, weight: 13 g

Series 602, weight: 18 g

Series 652, weight: 13 g

Conversion formula for the above series:  $\dot{V}_2 = \dot{V}_1 * \sqrt{\frac{p_2}{p_1}}$

# High pressure flat fan nozzles

## Series 6FH

**With spray stabilizer. Sharp uniform flat fan with an extremely narrow jet depth.**

Applications:

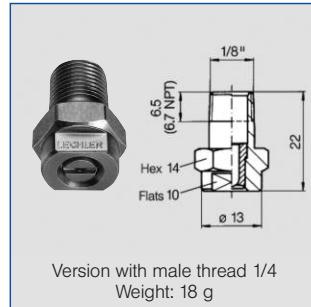

High pressure cleaning.

Materials:

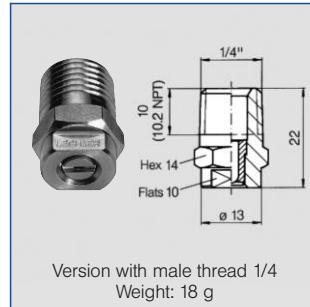

Nozzle body: 303 SS

Insert: Hardened stainless steel  
420F SS

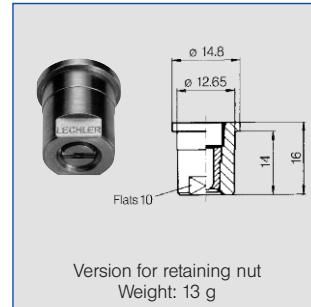

Spray stabilizer: 301 SS

Version with male thread 1/4  
Weight: 18 g

Version with male thread 1/4  
Weight: 18 g

Version for retaining nut  
Weight: 13 g

| <b>29</b>       | Retaining nut | approx. 300               |

\*\* Only valid for operation at constant pressure.

**Example      Nozzle code + Flow rate code + Material no. + Connection code = Ordering no.**  
**for ordering: 6FH      + 361      + A3      + CA = 6FH. 361. A3. CA**  
**(Flat fan 20°; 4.56 l/min. at 100 bar; 1/8 BSPT)**

## Tongue-type nozzles for retaining nut

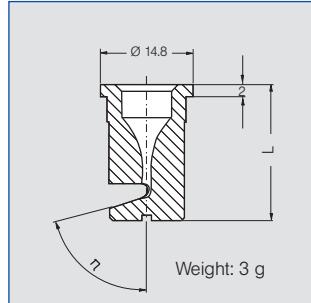

### Series 684

**Assembly with retaining nut.**  
**Wide flat fan with a sharply delimited spray pattern.**  
**Not prone to clogging. Easy nozzle changing, simple jet alignment.**

Applications:

Foam control in storage tanks and sewage treatment plants.  
 Cleaning and washing process, requiring powerful and concentrated water jets.

B = bore diameter

Can also be used for air or saturated steam.

\* Only available with code CA

Example      Type      + Material no.      + Code = Ordering no.  
for ordering:    686.366    + 30                + CA    = 686.366.30.CA

## Tongue-type nozzles

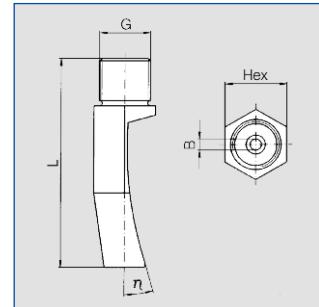

### Series 688/689

**Hard, sharp flat fan, narrowly delimited jet pattern.  
Not prone to clogging.**

Applications:

Cleaning, washing, degreasing and phosphating, preparation techniques.

B = bore diameter

Example      Type      +    Material no.      +    Code    =    Ordering no.  
for ordering: 688. 603    +    16                +    CC    =    688. 603. 16. CC

Conversion formula for the above series:  $\dot{V}_2 = \dot{V}_1 * \sqrt{\frac{p_2}{p_1}}$

## Axial-flow full cone nozzles

Series 490/491

Patented

**Non-clogging nozzle design with a very stable spray angle, particularly even liquid distribution and large free cross sections.**

Applications:

Cleaning and washing processes, surface spraying, container cleaning, foam precipitation, degassing of liquids.

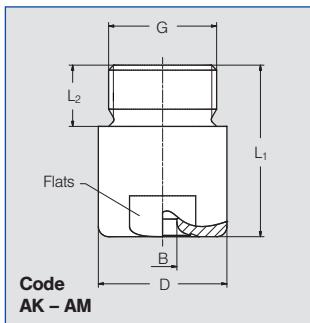

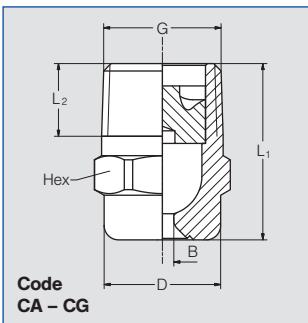

Series 490

Series 491

**Series 490/491 represents a new generation within the axial-flow full cone nozzles product group. These nozzles were developed using state-of-the-art design and simulation methods (CFD).**

**Nozzles of series 490/491 replace series 460/461 which are still available on request.**

B = bore diameter · E = narrowest free cross section

Example for ordering:  
490. 406 + 1Y + CA = 490. 406. 1Y. CA

Other nozzle materials (special alloys, plastics) are available on request.

Conversion formula for the above series:  
( $\leq 10$  bar)  $\dot{V}_2 = \dot{V}_1 * \left( \frac{p_2}{p_1} \right)^{0.4}$

## Axial-flow full cone nozzles

### Series 460/461

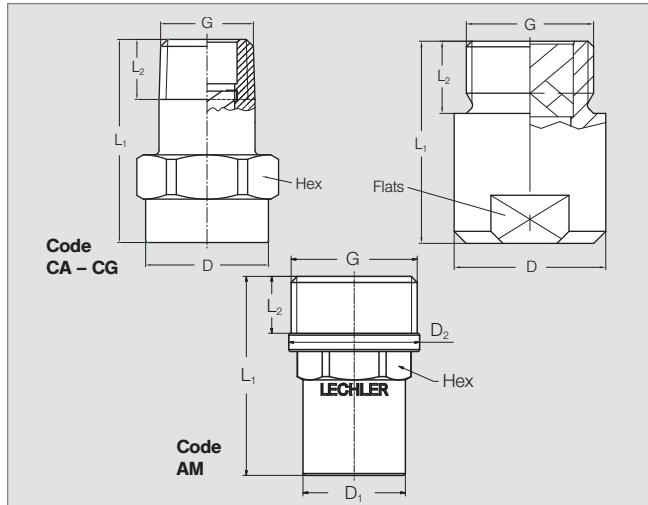

**Very uniform spray pattern.  
Large free cross-sections,  
due to optimized x-style swirl  
insert.**

#### Applications:

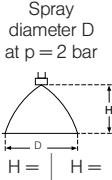

Cleaning and washing process,  
cooling of gaseous fluids and  
solids, surface spraying, spraying  
onto mats in air washers,  
improving of chemical reactions.

B = bore diameter · E = narrowest free cross section

Material PP (material no. 53)

\* Connection 3/4 BSPT

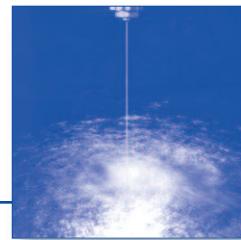

Example      Type      +    Material no.    +    Code    =    Ordering no.  
for ordering: 460.408 + 5E + CA = 460.408.5E.CA

Conversion formula for the above series:  
(≤ 10 bar)       $\dot{V}_2 = \dot{V}_1 * \left( \frac{p_2}{p_1} \right)^{0.4}$

# High-pressure solid stream nozzles

## Series 546/548/550

**Punctiform, extremely tight,  
non-dispersing solid stream.**

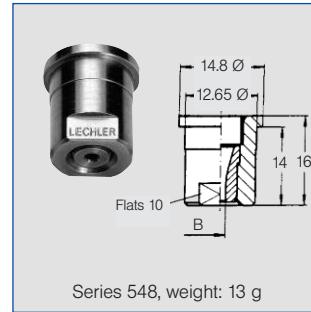

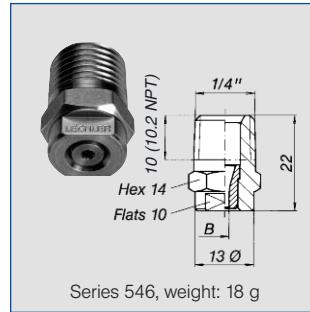

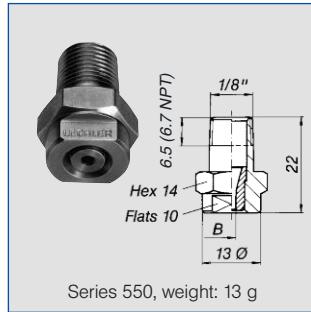

**Highest impact.**

Applications:

High-pressure cleaning,  
cutting and separating.

Materials:

Nozzle body: 303 SS  
Insert: Hardened  
stainless steel  
420F SS

B = bore diameter

| Connection code | Connection    | p <sub>max</sub> * [bar] |
|-----------------|---------------|--------------------------|
| A3.00           | BSPT          | approx. 700              |
| A3.07           | NPT           | approx. 700              |
| A3.29           | Retaining nut | approx. 300              |

\* Only valid for operation at constant pressure

Example for ordering: Nozzle code + Flow rate code + Connection code = Ordering no.  
550 + 360 + A3.07 = 550.360.A3.07 (Solid stream; 4.52 l/min. at 100 bar; 1/8 NPT)

## Eductor nozzles

### Series 500.262/500.428

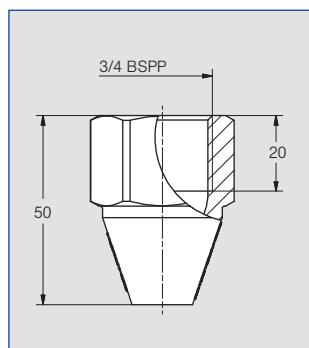

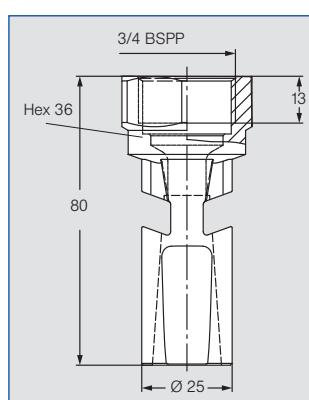

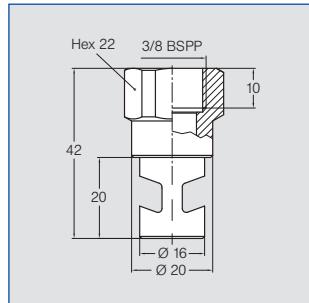

**No risk of blockage thanks to the large cross sections from 2.0 to 10.0 bar.**

Application:  
Tank mixing, liquid circulation,  
preventing sedimentation

Material:

- ① Polypropylene
- ② + ③ Polypropylene  
Fibreglass reinforced

(incl. attachment material: screw, hexagon nut, washer, details on request)

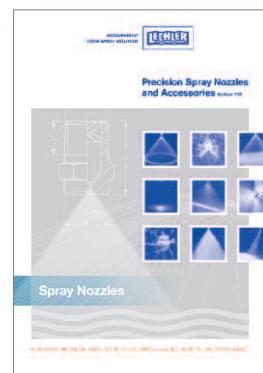

**Version with two clips available on request**

# YOU WILL FIND OTHER NOZZLES FOR USE IN SURFACE TECHNOLOGY IN OUR STANDARD CATALOGUE ...

Over the years, our catalogue "Precision Spray Nozzles and Accessories" has become an in-demand nozzle technology

handbook. It contains valuable tools and comprehensive technical information on Lechler products.

For a long time, many Lechler products have been used to satisfy a very wide range of surface treatment applications.

| Pneumatic atomizing nozzles   | Series     | Spray pattern   | Mode of liquid supply                   | Mixing of fluids                                       |   | $\dot{V}$ Water [l/h] | Application/Design              | Catalogue page |
|---|------------|---|---|--|--|-----------------------|---------------------------------|----------------|
|    | 136        | Full cone or flat fan   | Pressure principle or suction principle | Internal or external                                   | 20°<br>45°<br>60°<br>80°   | 0.10 – 132.90         | Humidification of air, cooling. | 1.3            |
| Axial-flow hollow cone nozzles  | Series     |    | $\dot{V}$ [l/min] at $p = 2$ bar        | Connection   | Application/Design   | Catalogue page        |                                 |                |
|   | 220        | 60°<br>80°  | 0.013 – 0.390 (at $p = 5$ bar)          | 1/4 BSPP   | Disinfection, humidification, cooling.<br><b>Extremely fine, fog-like hollow cone spray.</b>   | 2.5                   |                                 |                |
| Eccentric hollow cone nozzles   | Series     |  | $\dot{V}$ [l/min] at $p = 2$ bar        | Connection   | Application/Design   | Catalogue page        |                                 |                |
|  | 302        | 60°<br>80°<br>90°<br>130°   | 0.40 – 25.00                            | 3/8 BSPP   | Humidification of air in air washers, dust control, spraying onto filters, foam control, cooling.<br><b>Non-clogging nozzle design, without swirl insert.</b>  | 2.8<br>2.9            |                                 |                |
| Full cone nozzles   | Series     |  | $\dot{V}$ [l/min] at $p = 2$ bar        | Connection   | Application/Design   | Catalogue page        |                                 |                |
|  | 422<br>423 | 60°<br>90°<br>120°  | 1.00 – 100.00                           | 1/4 BSPT<br>3/8 BSPT<br>1/2 BSPT<br>3/4 BSPT<br>1 BSPT | Cleaning and washing process, cooling of gaseous fluids and solids, surface spraying, spraying onto mats in air washers, improving on chemical reactions, continuous casting.<br><b>Without swirl inserts, non-clogging.</b> | 3.12<br>3.13          |                                 |                |

| Full cone nozzles  | Series     |  | $\dot{V}$ [l/min]<br>at $p = 2$ bar | Connection                                      | Application/<br>Design  | Catalogue<br>page |
|--|------------|---|-------------------------------------|---|---|-------------------|
|   | 502<br>503 | 70°<br>130°   | 1.25 – 60.00                        | 1/2 BSPP<br>3/4 BSPP                            | Cooling of gaseous and solid material, desuperheating, chlorine precipitation, absorption as well as for improvement of chemical reaction by enlarging the contact area.<br><b>Fine full cone atomization with the aid of several hollow cones spraying into one another.</b> | <b>3.15</b>       |
| Flat fan nozzles   | Series     |  | $\dot{V}$ [l/min]<br>at $p = 2$ bar | Connection                                      | Application/<br>Design  | Catalogue<br>page |

## ... AND IN DIFFERENT SPECIAL BROCHURES

We have a collection of information, included in individual subject brochures, covering special nozzles that are also of particular interest to surface technology applications.

All documents can be downloaded from our website at [www.lechler.com](http://www.lechler.com).

We would also be happy to send you the brochures.

Brochure „Precision Spray Nozzles for Tank and Equipment Cleaning“

Brochure „Air Nozzles and Accessories“

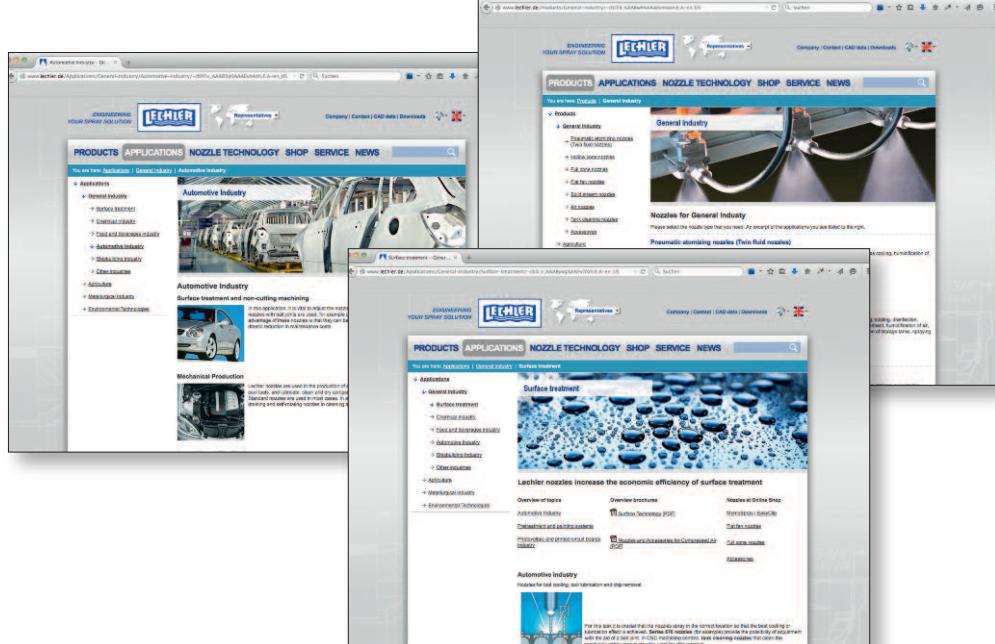

## Online-Services

### FULL INFORMATION IS JUST A CLICK AWAY: THE LECHLER WEBSITE

On the internet you can also find additional information about our entire range of services, work aids, our global presence and much more besides – we look forward to your visit.

[www.lechler.com](http://www.lechler.com)

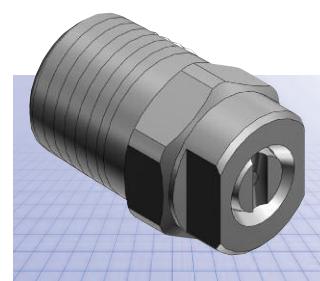

### 3D DESIGN DATA FOR YOUR WORK

3D design data for Lechler nozzles and accessories is now available to you free of charge for your design work.

<http://lechler.partcommunity.com>

- Time-saving, immediate download of design drawings and technical data
- Simple, fast product selection
- Preview function with product photo and 3D graphics
- All popular 3D formats available
- Free use following one-time registration

### LECHLER INDUSTRY APP

Android (Google)

iOS (Apple)

All important calculation and conversion programs for nozzle technology combined in one App.

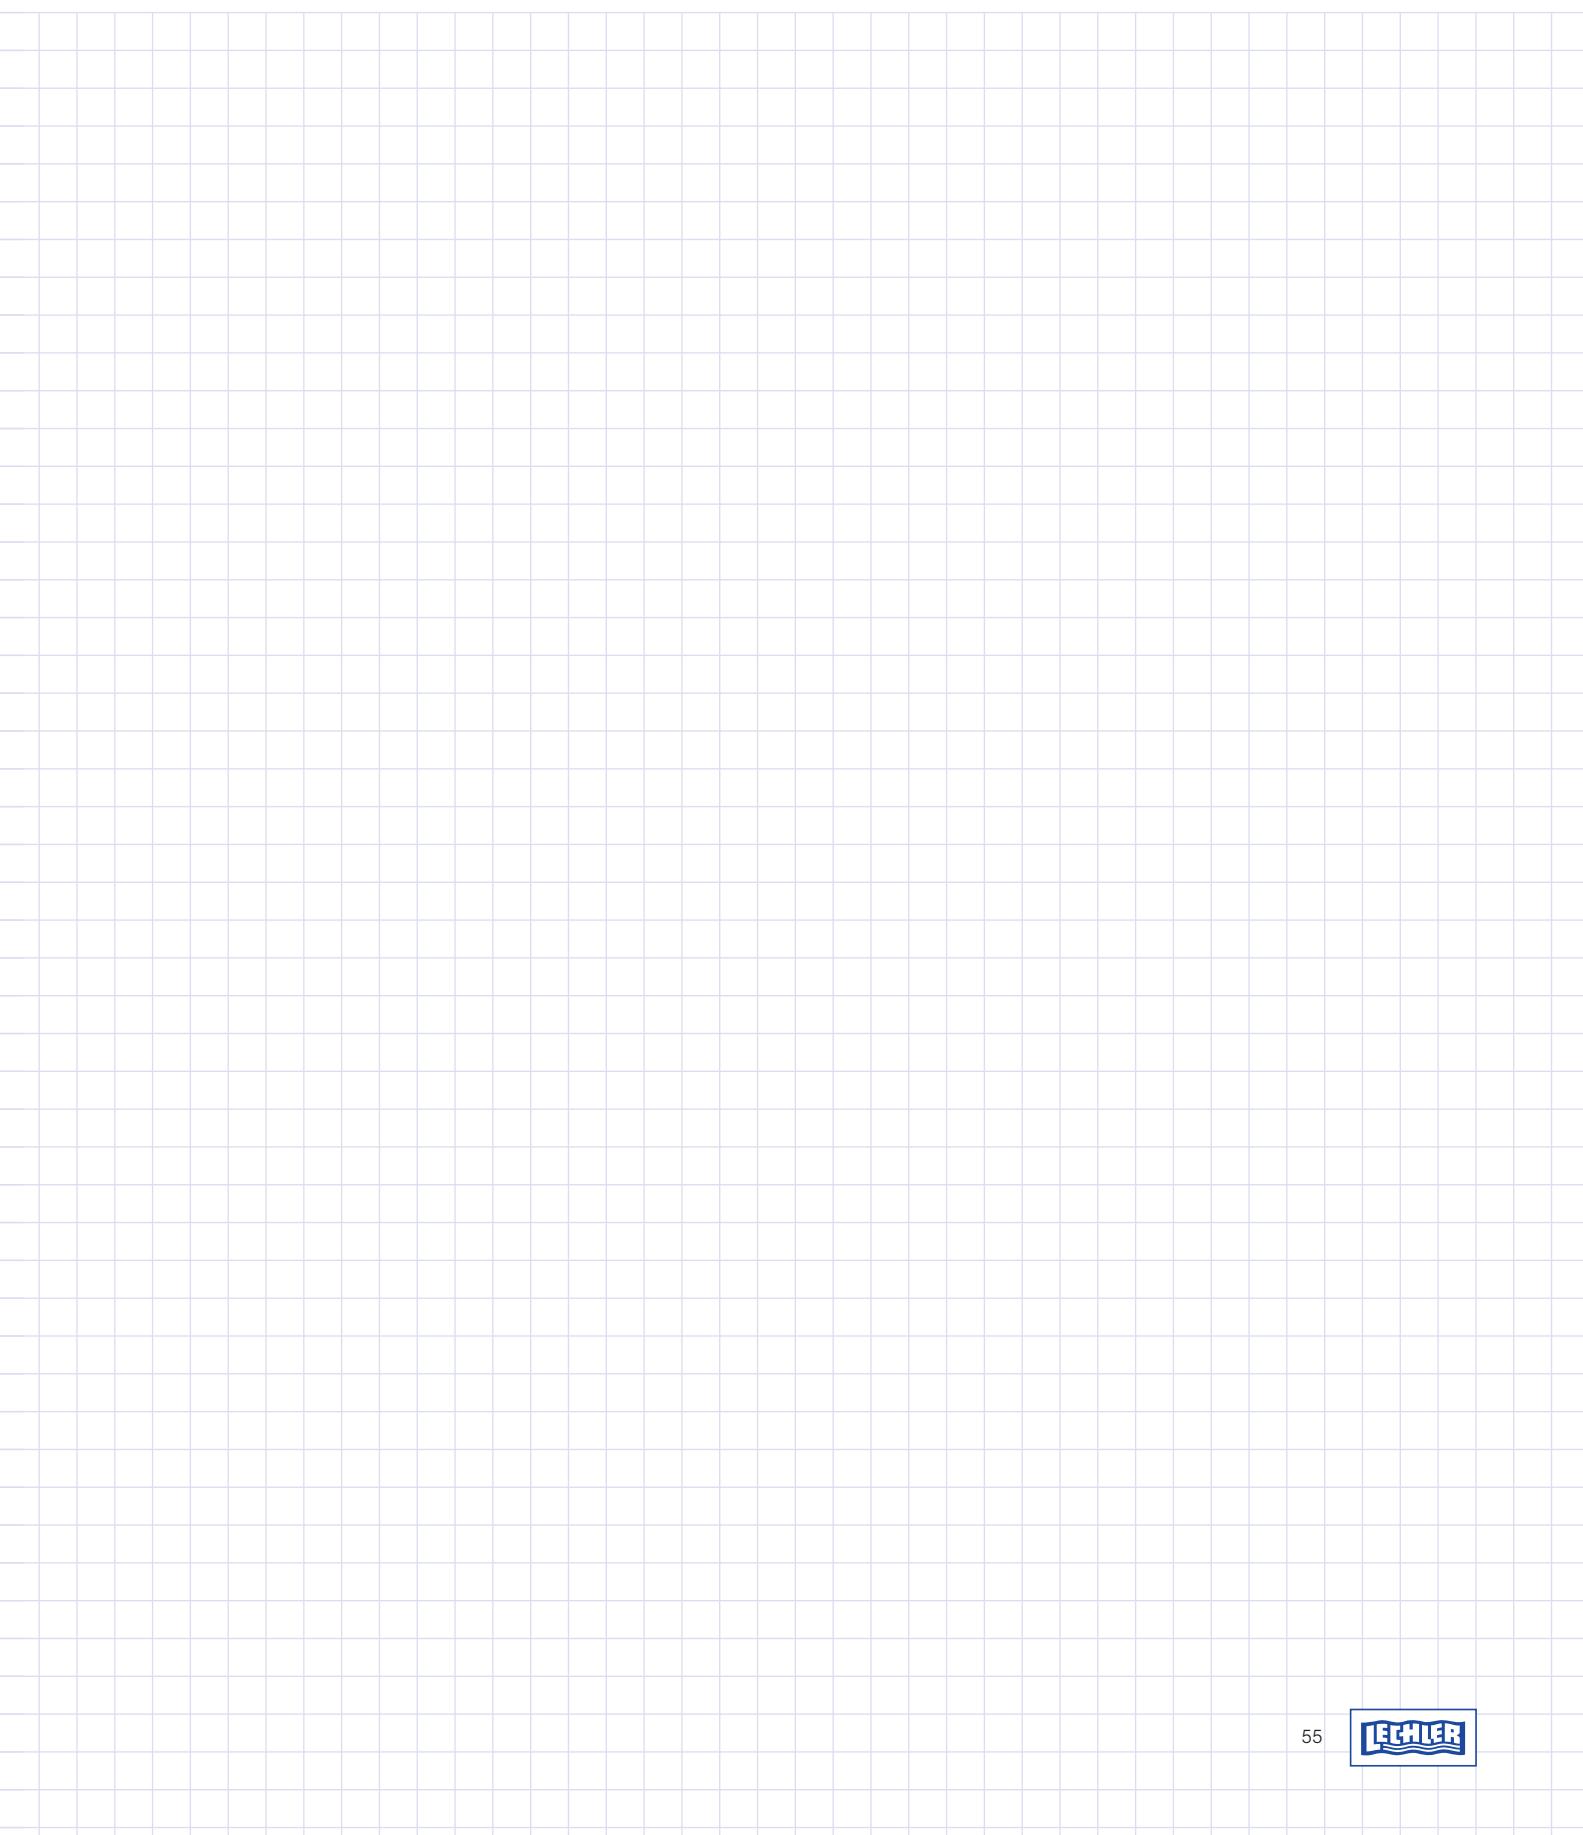

- Unit converter for pressure, volume and flow rate
- Pressure/flow rate calculator for single-fluid nozzles incl. axial-flow full cone nozzles
- Calculation of pipe diameters
